

Hitachi Virtual Storage Platform 5000 Series

SVOS RF 9.8

Hitachi Alert Notification Guide

The Alert Notification feature provides failure monitoring functions (which include monitoring of your storage systems by using SNMP), enabling you to recognize and fix failures in your storage system.

Preface

The Alert Notification feature provides failure monitoring functions (which include monitoring of your storage systems by using SNMP), enabling you to recognize and fix failures in your storage system.

Please read this document carefully to understand how to use this product, and maintain a copy for reference purposes.

Intended audience

This document is intended for system administrators, Hitachi Vantara representatives, and authorized service providers who install, configure, and operate Hitachi Virtual Storage Platform 5000 series storage systems.

Readers of this document should be familiar with the following:

- Data processing and RAID storage systems and their basic functions.
- Hitachi Virtual Storage Platform 5000 series storage systems and the *Product Overview*.
- The Device Manager - Storage Navigator software for the Hitachi Virtual Storage Platform 5000 series, and the *System Administrator Guide*.

Product version

This document revision applies to the following product versions:

- VSP 5000 series: microcode 90-08-01 or later
- SVOS RF 9.8 or later

Release notes

Read the release notes before installing and using this product. They may contain requirements or restrictions that are not fully described in this document or updates or corrections to this document. Release notes are available on the Hitachi Vantara Support Website: <https://knowledge.hitachivantara.com/Documents>.

Changes in this revision

- Added and corrected SIMs.
- Added a note on downloading audit logs in syslog format during upgrade or downgrade.

Document conventions

This document uses the following typographic conventions:

Convention	Description
Bold	<ul style="list-style-type: none"> ▪ Indicates text in a window, including window titles, menus, menu options, buttons, fields, and labels. Example: Click OK. ▪ Indicates emphasized words in list items.
<i>Italic</i>	<ul style="list-style-type: none"> ▪ Indicates a document title or emphasized words in text. ▪ Indicates a variable, which is a placeholder for actual text provided by the user or for output by the system. Example: <pre>pairdisplay -g group</pre> <p>(For exceptions to this convention for variables, see the entry for angle brackets.)</p>
Monospace	Indicates text that is displayed on screen or entered by the user. Example: <code>pairdisplay -g oradb</code>
< > angle brackets	Indicates variables in the following scenarios: <ul style="list-style-type: none"> ▪ Variables are not clearly separated from the surrounding text or from other variables. Example: <pre>Status-<report-name><file-version>.csv</pre> ▪ Variables in headings.
[] square brackets	Indicates optional values. Example: [a b] indicates that you can choose a, b, or nothing.
{ } braces	Indicates required or expected values. Example: { a b } indicates that you must choose either a or b.
vertical bar	Indicates that you have a choice between two or more options or arguments. Examples: [a b] indicates that you can choose a, b, or nothing.

Convention	Description
	{ a b } indicates that you must choose either a or b.

This document uses the following icons to draw attention to information:

Icon	Label	Description
	Note	Calls attention to important or additional information.
	Tip	Provides helpful information, guidelines, or suggestions for performing tasks more effectively.
	Caution	Warns the user of adverse conditions and/or consequences (for example, disruptive operations, data loss, or a system crash).
	WARNING	Warns the user of a hazardous situation which, if not avoided, could result in death or serious injury.

Conventions for storage capacity values

Physical storage capacity values (for example, disk drive capacity) are calculated based on the following values:

Physical capacity unit	Value
1 kilobyte (KB)	1,000 (10 ³) bytes
1 megabyte (MB)	1,000 KB or 1,000 ² bytes
1 gigabyte (GB)	1,000 MB or 1,000 ³ bytes
1 terabyte (TB)	1,000 GB or 1,000 ⁴ bytes
1 petabyte (PB)	1,000 TB or 1,000 ⁵ bytes
1 exabyte (EB)	1,000 PB or 1,000 ⁶ bytes

Logical capacity values (for example, logical device capacity, cache memory capacity) are calculated based on the following values:

Logical capacity unit	Value
1 block	512 bytes
1 cylinder	Mainframe: 870 KB Open-systems: ▪ OPEN-V: 960 KB ▪ Others: 720 KB
1 KB	1,024 (2^{10}) bytes
1 MB	1,024 KB or $1,024^2$ bytes
1 GB	1,024 MB or $1,024^3$ bytes
1 TB	1,024 GB or $1,024^4$ bytes
1 PB	1,024 TB or $1,024^5$ bytes
1 EB	1,024 PB or $1,024^6$ bytes

Accessing product documentation

Product user documentation is available on the Hitachi Vantara Support Website: <https://knowledge.hitachivantara.com/Documents>. Check this site for the most current documentation, including important updates that may have been made after the release of the product.

Getting help

The [Hitachi Vantara Support Website](https://support.hitachivantara.com/en_us/contact-us.html) is the destination for technical support of products and solutions sold by Hitachi Vantara. To contact technical support, log on to the Hitachi Vantara Support Website for contact information: https://support.hitachivantara.com/en_us/contact-us.html.

[Hitachi Vantara Community](https://community.hitachivantara.com) is a global online community for Hitachi Vantara customers, partners, independent software vendors, employees, and prospects. It is the destination to get answers, discover insights, and make connections. **Join the conversation today!** Go to community.hitachivantara.com, register, and complete your profile.

Comments

Please send us your comments on this document to doc.comments@hitachivantara.com. Include the document title and number, including the revision level (for example, -07), and refer to specific sections and paragraphs whenever possible. All comments become the property of Hitachi Vantara LLC.

Thank you!

Chapter 1: Failure monitoring

You can use alert notification email, Syslog, and SNMP for failure monitoring.

Alert notification email

The following gives an example of an alert notification email that is sent from a storage system to the mail server.

```
VSP 5100 Report
//RAID900 //VSP //////////////////////////////////////
//e-Mail Report
////////////////////////////////////
Date : 20/04/2018
Time : 00:20:00
Machine : VSP 5100(Serial# 64019)
RefCode : 7fffff
Detail: This is Test Report.
```

The following table describes the components of an alert notification email.

Component	Item in the example	Description
Title	VSP 5100 Report	<i>product-name-of-the-storage-system</i> Report
Additional information	//RAID900 // VSP ////////////////////////////////////// //e-Mail Report ////////////////////////////////////	The information set in Editing alert notification email settings (on page 16) Nothing appears if no information is set.
Date	Date : 20/04/2018	The date when the error occurred
Time	Time : 00:20:00	The time when the error occurred
Hardware identification	Machine : VSP 5100(Serial# 64019)	<i>storage-system-name-set-in-Storage-Navigator(serial# serial-number)</i>
Failure code	RefCode : 7fffff	The reference code that appears in the alert window

Component	Item in the example	Description
Failure detail	Detail: This is Test Report.	Information of failure locations that need maintenance Information of a maximum of eight failure locations appears. Each information item includes the following items: action code, assumed failure part, and location.

Syslog

The following gives examples of Syslog data that is sent from a storage system to the syslog server.

You can use the maintenance utility to select either of the following message formats: RFC3164-compliant or RFC5424-compliant.

For details, see [Editing Syslog settings \(on page 19\)](#)

Syslog file format (RFC3164-compliant)

```
<149> Jan 24 18:10:30 GUM Storage: 0000001571,Service,H2(Serial#400102),Japan-Tokyo,
 1         2         3         4         5         6         7         8
RefCode:7FFA00,Synchronization time failure
 9
```

No.	Item	Description
1	Priority	<p>The priority of a syslog message is determined according to the following formula, enclosed by angle brackets (< >):</p> $\text{Priority} = 8 \times \text{Facility} + \text{Severity}$ <p><i>Facility</i> is 18 (fixed).</p> <p><i>Severity</i> depends on the type of log information:</p> <ul style="list-style-type: none"> ▪ 3: Error (abnormal end) ▪ 4: Warning (partially abnormal end, or an operation was canceled before it could be completed) ▪ 5: Notice (normal end) <p>For example, if <i>Severity</i> is 3 (Error), <147> is output as the priority value.</p>

No.	Item	Description
2	Date, time ¹	<p>The date and time in the format of "MMM DD HH:MM:SS"</p> <ul style="list-style-type: none"> ▪ <i>MMM</i>: first three letters of the month (Jan to Dec) ▪ <i>DD</i>: date <p>If <i>DD</i> is a single digit (for example, 1), it is displayed as " 1" (with a blank space before "1") and not as "01".</p> <ul style="list-style-type: none"> ▪ <i>HH</i>: hour ▪ <i>MM</i>: minute ▪ <i>SS</i>: second
3	Detected location	"GUM" (fixed)
4	Program name	"Storage" (fixed)
5	Message identification	The serial number (0000000000 to 4294967295)
6	Event type	<p>Any of the following event category names. (The event category corresponds to <i>Severity</i>.)</p> <ul style="list-style-type: none"> ▪ Acute <i>Severity</i> is 3 (Error). ▪ Serious <i>Severity</i> is 3 (Error). ▪ Moderate <i>Severity</i> is 4 (Warning). ▪ Service <i>Severity</i> is 5 (Notice).
7	Hardware identification ²	The storage system name and serial number
8	Related information	The location identification information set in the Syslog tab of the maintenance utility
9	Detailed information	The SIM reference code and failure information that are displayed in the alert window
<p>Notes:</p> <p>1. A date and time being set on SVP are output as log data. If a failure, such as a SVP failure and a LAN failure, occurs in the storage system, the date and time may be output of the accumulated date and time since January 01, 1970.</p>		

No.	Item	Description
2.		While the controller model is being upgraded, information before upgrade might be output. While the controller model is being downgraded, information before downgrade might be output.

Syslog file format (RFC5424-compliant)

```

<149>1 2017-01-24T18:17:09.0+09:00 GUM Storage - - - 0000001572,Service,H2(Serial#400102),
 1 2 3 4 5 678 9 10 11
Japan-Tokyo,RefCode:7FFA00,Synchronization time failure
 12 13

```

No.	Item	Description
1	Priority	<p>The priority of a syslog message is determined according to the following formula, enclosed by angle brackets (< >):</p> $\text{Priority} = 8 \times \text{Facility} + \text{Severity}$ <p><i>Facility</i> is 18 (fixed).</p> <p><i>Severity</i> depends on the type of log information:</p> <ul style="list-style-type: none"> ▪ 3: Error (abnormal end) ▪ 4: Warning (partially abnormal end, or an operation was canceled before it could be completed) ▪ 5: Notice (normal end) <p>For example, if <i>Severity</i> is 3 (Error), <147> is output as the priority value.</p>
2	Version	"1" (fixed)
3	Date, time ¹	<p>The date, time, and the time difference between UTC (Coordinated Universal Time) and the local time in the format of "YYYY-MM-DDThh:mm:ss.±hh:mm"</p> <ul style="list-style-type: none"> ▪ YYYY: year, MM: month, DD: date ▪ hh: hour, mm: minute, ss.s: second in one decimal place ▪ ±hh:mm: hours and minutes of the time difference. "Z" is written instead of "± hh:mm" when there is no time difference between UTC and the local time, such as "2018-12-26T23:06:58.0Z".
4	Detected location	"GUM" (fixed)
5	Program name	"Storage" (fixed)
6	Process name	"-" (fixed.)

No.	Item	Description
7	Message ID	"-" (fixed.)
8	Structured data	"-" (fixed.)
9	Message identification	The serial number (0000000000 to 4294967295)
10	Event type	Any of the following event category names. (The event category corresponds to <i>Severity</i> .) <ul style="list-style-type: none"> ▪ Acute <i>Severity</i> is 3 (Error). ▪ Serious <i>Severity</i> is 3 (Error). ▪ Moderate <i>Severity</i> is 4 (Warning). ▪ Service <i>Severity</i> is 5 (Notice).
11	Hardware identification ²	The storage system name and serial number
12	Related information	The location identification information set in the Syslog tab of the maintenance utility
13	Detailed information	The SIM reference code and failure information that are displayed in the alert window
<p>Notes:</p> <ol style="list-style-type: none"> 1. A date and time being set on SVP are output as log data. If a failure, such as a SVP failure and a LAN failure, occurs in the storage system, the date and time may be output of the accumulated date and time since January 01, 1970. 2. While the controller model is being upgraded, information before upgrade might be output. While the controller model is being downgraded, information before downgrade might be output. 		

SNMP

SNMP data is sent from a storage system to the SNMP agent. The following table describes an example of event details that are contained in SNMP data.

Component	Example	Description
TRAP type	raideventUsermoderate	Failure level
eventTrapSerialNumber	1	Serial number of the product
eventTrapNickname	RAID900	Product name
eventTrapREFCODE	212051	The reference code that appears in the alert window
eventTrapPartsID	dkcHWProcessor	Failure location
eventTrapDate	2018/12/21	The date the SNMP Agent received the SNMP data
eventTrapTime	08:27:50	The time the SNMP Agent received the SNMP data
eventTrapDescription	"Channel port blocking"	Information of the failure locations that need maintenance

Chapter 2: Setting alert notification email

By using the Hitachi Device Manager - Storage Navigator, you can manage the alert notification email settings.

Editing alert notification email settings

This topic describes how to specify the email settings necessary to report failure trap reference codes (SIMs).

Before you begin

- You must have the Storage Administrator (Initial Configuration) role to perform this task.
- You must have installed a mail server that supports Simple Mail Transfer Protocol (SMTP). The SVP uses LOGIN of SMTP authentication (SMTP-AUTH) to connect to the mail server. PLAIN, CRAM-MD5, and DIGEST-MD5 of SMTP-AUTH are not supported.
- You must release Port 25 if a firewall is used (because Port 25 is used for communication between the SVP and the mail server).

Procedure

1. Display the Device Manager - Storage Navigator main window.
2. From the **Settings** menu, select **Environmental Setting > Edit Alert Settings**.
3. For **Notification Alert**, select one of the following:
 - **All** (Sends alerts of all SIMs.)
 - **Host Report** (Sends alerts only of SIMs that report to hosts.)Alert destinations are common to Syslog, SNMP, and Email.
4. Click the **Email** tab.
5. For **Mail Notice**, select **Enable** to enable that option.

6. In **Email Settings**, enter the destination email address and the attribute (To, Cc, Bcc).
 - To add an email address, click **Add** and then specify the email address and attribute in the **Add Address** window.
 - To change an email address and the attribute, select the check box for the email address you want to change, and then click **Change**. You can change the email address and attribute in the **Change Settings** window.

You can select multiple email addresses. If you select multiple email addresses, you can change their attributes only.

- To delete email addresses, select the check boxes for the email addresses you want to delete, and then click **Delete**.

Make sure that you specify these settings if **Mail Notice** is set to **Enable**.

7. Enter the source email address (required) and the return email address (option).
You can enter up to 255 characters of alphabets, numerals, and symbols (!, #, \$, %, &, ` , +, -, *, /, ', ^, {, }, _, and .).
8. Enter the information of the email server.

- **Identifier**

To specify the host name, select **Identifier** and then enter up to 63 characters of alphabets, numerals, and symbols (! \$ % () ' - _ . @ ~).

- **IPv4**

To specify an IPv4 address, select **IPv4** and then enter four numbers (0 to 255) in the following format:

XXX.XXX.XXX.XXX (Each XXX indicates a number.)

- **IPv6**

To specify an IPv6 address, select **IPv6** and then enter eight hexadecimal numbers (0 to FFFF) in the following format:

YYYY:YYYY:YYYY:YYYY:YYYY:YYYY:YYYY:YYYY (Each YYYY indicates a hexadecimal number.)

You can also specify the abbreviated format of IPv6 addresses.

Make sure that you specify these settings if **Mail Notice** is set to **Enable**.

9. In **SMTP Authentication**, select **Enable** (to use SMTP authentication) or **Disable** (to not to use SMTP authentication). If you select **Enable**, also enter the account name and password that you use for SMTP authentication.

You can enter up to 255 characters of alphabets, numerals, and symbols (! \$ % () ' - _ . @ ~).

Make sure that you specify these settings if **Mail Notice** is set to **Enable**.

10. Click **Send Test Email**, if necessary, to test the settings.
11. Confirm that you received the test email.
12. Click **Finish**.
13. Confirm the settings in the **Confirm** window, and then enter the task name in **Task Name**.

14. Click **Apply.**

The task is registered. If the check box for **Go to tasks window for status** is selected, the **Tasks** window opens.

Chapter 3: Setting Syslog

By using the Hitachi Device Manager - Storage Navigator, you can manage Syslog settings.

Editing Syslog settings

This topic describes how to specify the Syslog settings necessary to report a failure in the storage system.

Before you begin

- You must have the Storage Administrator (Initial Configuration) role to perform this task.
- You must install a server that supports Syslog.
- You must release the port to be used for sending Syslog data if a firewall is used.
- If you use the new Syslog protocol (TLS1.2/RFC5424), you must specify, for subjectAltName or CommonName in the syslog server certificate, the host name or IP address of the syslog server.
- If you specify the host name of the syslog server as the transfer destination, you must register the host name and domain name of the syslog server in the DNS server.

Procedure

1. Display the Device Manager - Storage Navigator main window.
2. From the **Settings** menu, select **Environmental Setting > Edit Alert Settings**.
3. For **Notification Alert**, select one of the following:
 - **All** (Sends alerts of all SIMs.)
 - **Host Report** (Sends alerts only of SIMs that report to hosts.)Alert destinations are common to Syslog, SNMP, and Email.
4. Click the **Syslog** tab.
5. For **Transfer Protocol**, select the protocol you want to use for sending Syslog data.

6. To send Syslog data to the primary server, select **Enable** for **Primary Server** and then specify the following items:
 - IP Address/Host Name
Specify the IPv4 address, IPv6 address, or host name of the syslog server to which you want to send syslog data. To specify the host name, select **Identifier** and then enter up to 255 characters of alphabets, numerals, and symbols (! \$ % - . @ _ ` ~).
 - Port Number
 - Client Certificate File Name, Password, and Root Certificate File Name
Specify this setting only when **New Syslog Protocol (TLS1.2/RFC5424)** is selected for **Transfer Protocol**.
7. To send Syslog data to the alternative server (secondary server), select **Enable** for **Secondary Server** and then specify the following items:
 - IP Address/Host Name
 - Port Number
 - Client Certificate File Name, Password, and Root Certificate File Name
Specify this setting only when **New Syslog Protocol (TLS1.2/RFC5424)** is selected for **Transfer Protocol**.
8. Specify a name you want for **Location Identification Name** to identify the storage system.
9. If **New Syslog Protocol (TLS1.2/RFC5424)** is selected for **Transfer Protocol**, specify the values for **Timeout**, **Retry Interval**, and **Number of Retries**.
10. Click **Send Test Message to Syslog Server**, if necessary, to test the settings.
11. Confirm that the Syslog server received the log message (detailed data: "RefCode: 7FFFFFFF, This is Test Report.").
12. Click **Finish**.
13. Confirm the settings in the **Confirm** window, and then enter the task name in **Task Name**.
14. Click **Apply**.
The task is registered. If the check box for **Go to tasks window for status** is selected, the **Tasks** window opens.

Chapter 4: Setting SNMP

By using the Hitachi Device Manager - Storage Navigator, you can manage alert settings, SNMP trap notification, SNMP request authentication, and test SNMP trap reports.

Editing alert settings

This topic describes how to set the Edit Alert Settings.

Caution: Be sure to document your storage system name before this process, because the settings will be cleared when the SVP is replaced.

Before you begin

You must have the Storage Administrator (Initial Configuration) role to perform this task.

For more information, see the *System Administrator Guide*.

Procedure

1. Display the Device Manager - Storage Navigator main window.
2. From the **Settings** menu, select **Environmental Setting > Edit Alert Settings**.
3. For **Notification Alert**, select one of the following:
 - **All** (Sends alerts of all SIMs.)
 - **Host Report** (Sends alerts only of SIMs that report to hosts. Alert destinations are common to Syslog, SNMP, and Email.)
4. Click the **SNMP** tab.
5. For **Extension SNMP**, select **Enable** to enable that option.
6. In **System Group Information**, enter the **Storage System Name**, **Contact**, and **Location**.

Changes made to information here are also reflected in the **Storage System** window in Device Manager - Storage Navigator.
7. Click **Finish**.
8. Enter a name for the task in the **Confirm** window, confirm the settings, and then click **Apply**.

Managing SNMP trap notification

Use the procedure for the SNMP version you use to set SNMP trap notification. The items to specify are different depending on the SNMP version.

Adding trap notification for SNMP v1 and SNMP v2c

This topic describes the procedure to add IP addresses and communities to trap notification for SNMP v1 and SNMP v2c.

Before you begin

You must have the Storage Administrator (Initial Configuration) role to perform this task.

For more information, see the *System Administrator Guide*

Procedure

1. Display the Device Manager - Storage Navigator main window.
2. From the **Settings** menu, select **Environmental Setting > Edit Alert Settings**.
3. Click the **SNMP** tab.
4. Under **SNMP Agent**, select **Enable**.
5. Under **SNMP Version**, select **v1** or **v2c**.
6. Under **Registered Sending Trap Settings**, click **Add**.
7. In the **Add Sending Trap Setting** window, under **Community**, enter a community name or select from the list of existing community names.

You can enter up to 180 alphanumeric characters. The following special characters are not allowed: ", \, ;, :, , , *, ?, <, >, |, /, ^, &, ' , and %.

Do not use a space either at the beginning or the end.

8. Under **Send Trap To**, perform one or more of the following steps:
 - To enter a new IP address, select **IPv4** or **IPv6**, and then enter the IP address.
 - To use an existing IP address, select from the list of existing IP addresses.
 - To add more than one IP address, click **Add IP Address** to add additional input fields.
 - To delete an IP address from **Send Trap To**, click the minus (-) button next to the IP address.

Note: Any IP address that has all values set to zero (0) cannot be specified for IPv4 and IPv6. The IPv6 address is specified by entering eight hexadecimal numbers that are separated by colons (:) using a maximum of 4 digits from zero (0) to FFFF inclusive. The default form of the IPv6 address can be specified.

9. Click **OK**.
The IP address and community you entered are added to the **Registered Sending Trap Settings** table.
10. Click **Finish**.
11. In the **Confirm** window, enter a name for the task, confirm the settings, and then click **Apply**.

Adding trap notification for SNMP v3

This topic describes the procedure to add IP addresses and users to trap notification for SNMP v3.

Before you begin

You must have the Storage Administrator (Initial Configuration) role to perform this task.

For more information, see the *System Administrator Guide*.

Procedure

1. Display the Device Manager - Storage Navigator main window.
2. From the **Settings** menu, select **Environmental Setting > Edit Alert Settings**.
3. Click the **SNMP** tab.
4. Under **SNMP Agent**, select **Enable**.
5. Under **SNMP Version**, select **v3**.
6. Under **Registered Sending Trap Settings**, click **Add**.
7. In the **Add Sending Trap Setting** window, under **Send Trap To**, select **IPv4** or **IPv6**, and enter an IP address.

Note: Any IP address that has all values set to zero (0) cannot be specified for IPv4 and IPv6. The IPv6 address is specified by entering eight hexadecimal numbers that are separated by colons (:) using a maximum of 4 digits from zero (0) to FFFF inclusive. The default form of the IPv6 address can be specified.

8. Under **User Name**, enter a user name.
You can enter up to 32 alphanumeric characters. The following special characters are not allowed: ", \, ;, :, /, *, ?, <, >, |, /, ^, &, and %.
Do not use a space either at the beginning or the end.
9. Under **Authentication**, select whether to **Enable** or **Disable** authentication.
If you select **Enable**, complete the following steps:
 - a. For **Protocol**, select an authentication type.
 - b. For **Password**, enter a password.
10. Under **Encryption**, select whether to **Enable** or **Disable** encryption.

Note: If you select **Disable** for **Authentication**, **Encryption** is automatically disabled.

If you select **Enable**, complete the following steps:

- a. For **Protocol**, select an encryption type.
 - b. For **Key**, enter a key.
 - c. For **Re-enter Key**, enter the same key for confirmation.
11. Click **OK**.
The IP address and user you entered are added to the **Registered Sending Trap Settings** table.

12. Click **Finish**.
13. In the **Confirm** window, enter a name for the task, confirm the settings, and then click **Apply**.

Changing trap notification for SNMP v1 and SNMP v2c

This topic describes the procedure to change the IP addresses and communities for trap notification for SNMP v1 and SNMP v2c.

Before you begin

You must have the Storage Administrator (Initial Configuration) role to perform this task.

For more information, see the *System Administrator Guide*.

Procedure

1. Display the Device Manager - Storage Navigator main window.
2. From the **Settings** menu, select **Environmental Setting > Edit Alert Settings**.
3. Click the **SNMP** tab.
4. Under **SNMP Agent**, select **Enable**.
5. Under **SNMP Version**, select **v1** or **v2c**.
6. Under **Registered Sending Trap Settings**, select the trap setting you want to change, and then click **Change**.
The **Change Sending Trap Setting** window opens.
7. If you want to change the **Community**, select the **Community** check box, and then enter a community name or select from the list of existing community names.
You can enter up to 180 alphanumeric characters. The following special characters are not allowed: ", \, ;, :, , *, ?, <, >, |, /, ^, &, ', and %.
Do not use a space either at the beginning or the end.
8. If you want to make changes under **Send Trap to**, select the **Send Trap to** check box, and then perform one or more of the following steps:
 - To enter a new IP address, select **IPv4** or **IPv6**, and then enter the IP address.
 - To use an existing IP address, select from the list of existing IP addresses.
 - To add more than one IP address, click **Add IP Address** to add additional input fields.
 - To delete an IP address from **Send Trap To**, click the minus (-) button next to the IP address.

Note: Any IP address that has all values set to zero (0) cannot be specified for IPv4 and IPv6. The IPv6 address is specified by entering eight hexadecimal numbers that are separated by colons (:) using a maximum of 4 digits from zero (0) to FFFF inclusive. The default form of the IPv6 address can be specified.

9. Click **OK**.
The IP address and community you entered are changed in the **Registered Sending Trap Settings** table.
10. Click **Finish**.
11. In the **Confirm** window, enter a name for the task, confirm the settings, and then click **Apply**.

Changing trap notification for SNMP v3

This topic describes the procedure to change the IP addresses and users for SNMP v3 trap notification.

Before you begin

You must have the Storage Administrator (Initial Configuration) role to perform this task.

For more information, see the *System Administrator Guide*.

Procedure

1. Display the Device Manager - Storage Navigator main window.
2. From the **Settings** menu, select **Environmental Setting > Edit Alert Settings**.
3. Click the **SNMP** tab.
4. Under **SNMP Agent**, select **Enable**.
5. Under **SNMP Version**, select **v3**.
6. Under **Registered Sending Trap Settings**, select the trap setting you want to change, and then click **Change**.
The **Change Sending Trap Setting** window opens.
7. If you want to make changes under **Send Trap to**, select the **Send Trap to** check box, select **IPv4** or **IPv6**, and then enter an IP address.

Note: Any IP address that has all values set to zero (0) cannot be specified for IPv4 and IPv6. The IPv6 address is specified by entering 8 hexadecimal numbers that are separated by colons (:) using a maximum of 4 digits from zero (0) to FFFF inclusive. The default form of the IPv6 address can be specified.

8. If you want to change the **User Name**, select the **User Name** check box, and then enter a user name.
You can enter up to 32 alphanumeric characters. The following special characters are not allowed: ", \, ;, :, /, *, ?, <, >, |, /, ^, &, and %.
Do not use a space either at the beginning or the end.
9. If you want to make changes under **Authentication**, select the **Authentication** check box, and then select whether to **Enable** or **Disable** authentication.
If you select **Enable**, perform the following steps:
 - a. To change the **Protocol**, select the **Protocol** check box, and then select an authentication type.

- b. To change the **Password**, select the **Password** check box, and then enter a password.
10. If you want to make changes under **Encryption**, select the **Encryption** check box, and then select whether to **Enable** or **Disable** encryption.

Note: If you select **Disable** for **Authentication**, **Encryption** is automatically disabled.

If you select **Enable**, perform the following steps:

- a. To change the **Protocol**, select the **Protocol** check box, and then select an encryption type.
 - b. To change the **Key**, select the **Key** check box, enter a key, and then enter the key again under **Re-enter Key** for confirmation.
11. Click **OK**.
The IP address and user you entered are changed in the **Registered Sending Trap Settings** table.
 12. Click **Finish**.
 13. In the **Confirm** window, enter a name for the task, confirm the settings, and then click **Apply**.

Deleting SNMP trap notification

This topic describes the procedure to delete IP addresses and communities or users from SNMP trap notification.

Before you begin

You must have the Storage Administrator (Initial Configuration) role to perform this task.

For more information, see the *System Administrator Guide*.

Procedure

1. Display the Device Manager - Storage Navigator main window.
2. From the **Settings** menu, select **Environmental Setting > Edit Alert Settings**.
3. Click the **SNMP** tab.
4. Under **SNMP Agent**, select **Enable**.
5. Under **SNMP Version**, select your SNMP version.
6. Under **Registered Sending Trap Settings**, select one or more specific combinations of IP address and community or user, and then click **Delete**.
7. Click **Finish**.
8. In the **Confirm** window, enter a name for the task, confirm the settings, and then click **Apply**.

Managing SNMP request authentication

Use the procedure for the SNMP version you use to set SNMP request authentication. The items to specify are different depending on the SNMP version.

Adding request authentication for SNMP v1 and SNMP v2c

This topic describes how to add IP addresses and communities for request authentication for SNMP v1 and SNMP v2c.

Before you begin

You must have the Storage Administrator (Initial Configuration) role to perform this task.

For more information, see the *System Administrator Guide*.

Procedure

1. Display the Device Manager - Storage Navigator main window.
2. From the **Settings** menu, select **Environmental Setting > Edit Alert Settings**.
3. Click the **SNMP** tab.
4. Under **SNMP Agent**, select **Enable**.
5. Under **SNMP Version**, select **v1** or **v2c**.
6. Under **Registered Request Authentication Settings**, click **Add**.
7. In the **Add Request Authentication Setting** window, under **Community**, enter a community name or select from the list of existing community names.

You can enter up to 180 alphanumeric characters. The following special characters are not allowed: ", \, ;, :, ,, *, ?, <, >, |, /, ^, &, ', and %.

Do not use a space either at the beginning or the end.

8. Under **Request Permitted**, complete one of the following steps:
 - If you want to allow REQUEST operations from all managers, select the **All** check box.
 - If you want to allow REQUEST operations only from specified managers, perform one or more of the following steps:
 - To enter a new IP address, select **IPv4** or **IPv6**, and then enter the IP address.
 - To use an existing IP address, select from the list of existing IP addresses.
 - To add more than one IP address, click **Add IP Address** to add additional input fields.
 - To delete an IP address from **Send Trap To**, click the minus (-) button next to the IP address.
-  **Note:** Any IP address that has all values set to zero (0) cannot be specified for IPv4 and IPv6. The IPv6 address is specified by entering eight hexadecimal numbers that are separated by colons (:) using a maximum of 4 digits from zero (0) to FFFF inclusive. The default form of the IPv6 address can be specified.
9. Click **OK**
The community and IP address that you entered are added to the **Registered Request Authentication Settings** table.
 10. Click **Finish**.
 11. In the **Confirm** window, enter a name for the task, confirm the settings, and then click **Apply**.

Adding request authentication for SNMP v3

This topic describes how to add users for SNMP v3 request authentication.

Before you begin

You must have the Storage Administrator (Initial Configuration) role to perform this task.

For more information, see the *System Administrator Guide*.

Procedure

1. Display the Device Manager - Storage Navigator main window.
2. From the **Settings** menu, select **Environmental Setting > Edit Alert Settings**.
3. Click the **SNMP** tab.
4. Under **SNMP Agent**, select **Enable**.
5. Under **SNMP Version**, select **v3**.
6. Under **Registered Request Authentication Settings**, click **Add**.

7. In the **Add Request Authentication Setting** window, under **User Name**, enter a user name.

You can enter up to 32 alphanumeric characters. The following special characters are not allowed: ", \, ;, :, , , *, ?, <, >, |, /, ^, &, and %.

Do not use a space either at the beginning or the end.

8. Under **Authentication**, select whether to **Enable** or **Disable** authentication.

If you select **Enable**, complete the following steps:

- a. For **Protocol**, select an authentication type.
- b. For **Password**, enter a password.

9. Under **Encryption**, select whether to **Enable** or **Disable** encryption.

Note: If you select **Disable** for **Authentication**, **Encryption** is automatically disabled.

If you select **Enable**, complete the following steps:

- a. For **Protocol**, select an encryption type.
- b. For **Key**, enter a key.
- c. For **Re-enter Key**, enter the same key for confirmation.

10. Click **OK**.

The user you entered is added to the **Registered Request Authentication Settings** table.

11. Click **Finish**.

12. In the **Confirm** window, enter a name for the task, confirm the settings, and then click **Apply**.

Changing request authentication for SNMP v1 and SNMP v2c

This topic describes how to change IP addresses and communities for request authentication for SNMP v1 and SNMP v2c.

Before you begin

You must have the Storage Administrator (Initial Configuration) role to perform this task.

For more information, see the *System Administrator Guide*.

Procedure

1. Display the Device Manager - Storage Navigator main window.
2. From the **Settings** menu, select **Environmental Setting > Edit Alert Settings**.
3. Click the **SNMP** tab.
4. Under **SNMP Agent**, select **Enable**.
5. Under **SNMP Version**, select **v1** or **v2c**.
6. Under **Registered Request Authentication Settings**, select the authentication setting you want to change, and then click **Change**.
The **Change Request Authentication Setting** window opens.

7. If you want to make changes under **Community**, select the **Community** check box, and then enter a community name or select from the list of existing community names.
You can enter up to 180 alphanumeric characters. The following special characters are not allowed: ", \, ;, :, ,, *, ?, <, >, |, /, ^, &, ', and %.

Do not use a space either at the beginning or the end.

8. If you want to make changes under **Request Permitted**, select the **Request Permitted** check box, and then complete one of the following steps:
 - If you want to allow REQUEST operations from all managers, select the **All** check box.
 - If you want to allow REQUEST operations only from specified managers, perform one or more of the following steps:
 - To enter a new IP address, select **IPv4** or **IPv6**, and then enter the IP address.
 - To use an existing IP address, select from the list of existing IP addresses.
 - To add more than one IP address, click **Add IP Address** to add additional input fields.
 - To delete an IP address from **Send Trap To**, click the minus (-) button next to the IP address.

Note: Any IP address that has all values set to zero (0) cannot be specified for IPv4 and IPv6. The IPv6 address is specified by entering 8 hexadecimal numbers that are separated by colons (:) using a maximum of 4 digits from zero (0) to FFFF inclusive. The default form of the IPv6 address can be specified.

9. Click **OK**.
The community and IP address that you entered are changed in the **Registered Request Authentication Settings** table.
10. Click **Finish**.
11. In the **Confirm** window, enter a name for the task, confirm the settings, and then click **Apply**.

Changing request authentication for SNMP v3

This topic describes how to change users and authentication settings for SNMP v3 request authentication.

Before you begin

You must have the Storage Administrator (Initial Configuration) role to perform this task.

For more information, see the *System Administrator Guide*.

Procedure

1. Display the Device Manager - Storage Navigator main window.
2. From the **Settings** menu, select **Environmental Setting > Edit Alert Settings**.
3. Click the **SNMP** tab.

4. Under **SNMP Agent**, select **Enable**.
5. Under **SNMP Version**, select **v3**.
6. Under **Registered Request Authentication Settings**, click **Change**.
The **Change Request Authentication Setting** window opens.
7. If you want to change the **User Name**, select the **User Name** check box, and then enter a user name.

You can enter up to 32 alphanumeric characters. The following special characters are not allowed: ", \, ;, :, ,, *, ?, <, >, |, /, ^, &, and %.

Do not use a space either at the beginning or the end.
8. If you want to make changes under **Authentication**, select the **Authentication** check box, and then select whether to **Enable** or **Disable** authentication.

If you select **Enable**, perform the following steps:
 - a. To change the **Protocol**, select the **Protocol** check box, and then select an authentication type.
 - b. To change the **Password**, select the **Password** check box, and then enter a password.
9. If you want to make changes under **Encryption**, select the **Encryption** check box, and then select whether to **Enable** or **Disable** encryption.

 **Note:** If you select **Disable** for **Authentication**, **Encryption** is automatically disabled.

 If you select **Enable**, perform the following steps:
 - a. To change the **Protocol**, select the **Protocol** check box, and then select an encryption type.
 - b. To change the **Key**, select the **Key** check box, enter a key, and then enter the key again under **Re-enter Key** for confirmation.
10. Click **OK**.
The user you entered is added to the **Registered Request Authentication Settings** table.
11. Click **Finish**.
12. In the **Confirm** window, enter a name for the task, confirm the settings, and then click **Apply**.

Deleting SNMP request authentication

This topic describes how to delete IP addresses and communities or users from request authentication.

Before you begin

You must have the Storage Administrator (Initial Configuration) role to perform this task.

For more information, see the *System Administrator Guide*.

Procedure

1. Display the Device Manager - Storage Navigator main window.
2. From the **Settings** menu, select **Environmental Setting > Edit Alert Settings**.
3. Click the **SNMP** tab.
4. Under **SNMP Agent**, select **Enable**.
5. Under **SNMP Version**, select your SNMP version.
6. Under **Registered Request Authentication Settings**, select one or more specific combinations of IP address and community or user, and then click **Delete**.
7. Click **Finish**.
8. In the **Confirm** window, enter a name for the task, confirm the settings, and then click **Apply**.

Testing the SNMP trap report

This topic describes the procedure to test the SNMP trap report.

Before you begin

You must have the Storage Administrator (Initial Configuration) role to perform this task.

For more information, see the *System Administrator Guide*.

Procedure

1. Display the Device Manager - Storage Navigator main window.
2. From the **Settings** menu, select **Environmental Setting > Edit Alert Settings**.
3. Click the **SNMP** tab.
4. Click **Send Test SNMP Trap**.
The test SNMP trap is reported to the IP address registered in the storage system. The events registered in the storage system are reported instead of the events that are set on the **SNMP** tab. If you want to test the events set on the **SNMP** tab, click **Finish** and apply the changes to the storage system, and then report the test SNMP trap.
5. Verify that the SNMP trap report (reference code 7ffff) is received by the SNMP manager registered in the community.

Chapter 5: Troubleshooting

This chapter provides troubleshooting information for the Hitachi SNMP Agent.

Solving SNMP problems

The following problems can occur:

SNMP security function

If the SNMP security function is working, and a command is executed from an IP address that is not entered, you will get a "no reply" return, and a certification error is received for a trap.

SNMP cold trap function

- Depending on your network environment, you might not receive SNMP agent cold traps when the SVP is rebooted.
- The SNMP agent might report Link up/Link down Trap when the SVP reboots.
- A number of Link up/Link down Traps may be reported when the SVP OS is Windows 7.

Abnormal response to SNMP command

If an error occurs in the SVP, traps might not be sent.

While installing SVP High Reliability Kit

- Traps might not be reported for errors that occur during installation.
- SNMP commands might not respond normally.
- Cold traps might be reported repeatedly.
- Make sure to use `SVPsetup.exe` (or `setup.exe`) to install the secondary SVP. Otherwise, traps could be reported to an IP address that is not specified in SNMP settings.

Chapter 6: SNMP overview

This chapter provides an overview of the SNMP implementation for monitoring Hitachi Virtual Storage Platform 5000 series storage systems, including the agent and management functions.

SNMP Manager overview

SNMP Manager is installed in the network management station. It collects and manages information from SNMP agents installed in the managed devices on the network.

The SNMP Manager graphically displays information collected from two or more SNMP agents, accumulates the information in the database, and analyzes problems discovered while accumulating this information.

Note:

- SNMP versions v1, v2c, and v3 are supported.
- An RFC-compliant encryption algorithm is adopted for User-based Security Model (USM) authentication.

How SNMP works

Simple Network Management Protocol (SNMP) is an industry-standard protocol for managing and monitoring network devices, including disk devices, routers, and hubs. SNMP uses Simple Gateway Management Protocol (SGMP) to manage TCP/IP gateways.

The following figure shows an example SNMP environment.

An SNMP manager monitors the devices, which are referred to as managed nodes. Typically, an SNMP Manager polls the SNMP agents on a periodic basis. The manager receives the reports from the agents and determines whether the devices are operating normally. If an abnormal event occurs, an SNMP Agent can report the condition without a request from the manager, by using a trap message.

When an SNMP manager polls an agent, the following dialogue takes place:

- An SNMP Manager sends a request packet to an SNMP Agent, which requests data regarding the status of the managed node.
- The SNMP Agent sends a response packet back to the SNMP Manager.
- SNMP uses the TCP/IP User Datagram Protocol (UDP). If the SNMP Agent does not respond within a specified time period, the SNMP Manager re-sends the request packet. That time period is set by the system administrator, taking into account the network traffic and operation policy.
- If an SNMP Agent again does not respond to the resent packet, the SNMP Manager assumes that an error has occurred. Depending on the times set for polling and response, this dialogue can take several seconds.

If an SNMP Agent detects an abnormal event, it sends a trap to the SNMP Manager. However, if a trap is dropped in transmission, the SNMP Manager does not know that it was sent. For this reason, you should use both polling and traps to determine whether an abnormal event has occurred.

Management Information Base overview

The standardized configuration and database of network management information is called a Management Information Base (MIB). A standard MIB is common to all SNMP interfaces. An extension MIB is defined by the particular managed device or protocol.

A MIB is a collection of standardized configuration and network management information that is contained in each device on the network. Each MIB contains a set of parameters called managed objects. Each managed object consists of a parameter name, one or more parameters, and a group of operations that can be executed with the object. The MIB defines the type of information that can be obtained from a managed device, and the device settings that can be controlled from a management system.

The MIB definition file, `VSP5KMIB.txt`, is located in the `program\SNMP` folder of the software media kit.

SNMP Agent configuration

The SNMP Agent is installed on the service processor (SVP), which is the computer within the storage system that manages the storage system.

The storage system has an exclusive LAN for communications with the SVP and a separate LAN for SNMP. The configuration of each Network Management Station is determined by the type of SNMP manager.

The following figure illustrates the SNMP environment.

Note: If you cannot enter multiple MIB definition files in the SNMP Manager software, use the MIB definition file for VSP 5000 series. In this case, determine the storage system model by referring to the storage system nickname displayed in an error report.

The following figure shows an example of SNMP operations using an SNMP manager.

SNMP Agent overview

The SNMP Agent is mounted on a managed device (such as a hard disk) in the network. It collects error information, the usage condition, and other information about the device, and forwards the information to the SNMP Manager.

The SNMP Agent reports disk storage system failures to the manager using the SNMP trap function.

SNMP traps

An SNMP Agent reports storage system errors to the SNMP Manager using the SNMP trap function.

When an error occurs, the SNMP Agent issues an SNMP trap to the SNMP Manager that includes the product number, nickname, reference code, and an identifier of the component.

The following table lists the types of events that trigger an SNMP Agent trap.

Events	Description
Acute failure detected.	All operations in a storage system stopped.
Serious failure detected.	Operation in a component where a failure occurred stopped.
Moderate failure detected.	Partial failure.
Service failure detected.	Minor failure.

An SNMP Agent logs the most recent 10,000 traps, so you can see the trap history of a particular device.

SNMP Agent operations

Operations that an SNMP Agent can perform fall into the categories GET REQUEST, GETNEXT REQUEST, GETBULK REQUEST, and TRAP.

The following table describes the types of SNMP Agent operations.

Operation	Description
GET REQUEST	Obtains a specific MIB object value. GET REQUEST is the request from an SNMP Manager, and GET RESPONSE is the agent's response to that request.
GETNEXT REQUEST	Continuously finds a MIB object. GETNEXT REQUEST is the request from an SNMP Manager, and GET RESPONSE is the agent's response to that request.
GETBULK REQUEST	Continuously finds specified MIB objects only. GETBULK REQUEST is the request from an SNMP Manager, and GET RESPONSE is the agent's response to that request.
TRAP	Reports an event (failure) to an SNMP Manager. TRAP occurs without a request from the SNMP Manager.

SNMP Agent reported errors

Several different types of errors can be reported when GET REQUEST, GETNEXT REQUEST, and GETBULK REQUEST operations are sent to an SNMP Agent.

The following table describes the errors that can be reported and suggests corrective action.

Error	Description	Corrective action
noError (0)	Normal	N/A
noSuchName (2)	<ul style="list-style-type: none"> ▪ There are no MIB objects that are required. (Not supported.) ▪ The GETNEXT REQUEST command that is specified for the following object identifier of the last supported MIB object is received. 	Verify that the name of the requested object is correct.
	SET REQUEST is received.	SET REQUEST operation is not supported.
genErr (5)	Error occurred for other reasons.	Retry the operation.

Component status information from SNMP Manager

You can obtain the status information of certain storage system components from the SNMP Manager.

The following table lists the components for which the status can be obtained.

Area	Component name
Storage System	Processors
	BUS
	Cache
	Shared memory
	Power supplies
	Batteries
	Fans
	Others
Disk Unit	Power supplies
	Fans
	Environments
	Drives

The following table lists the status of storage system components, as well as the trap report functions.

Status	Description
Normal	Normal operation.
Acute failure detected	All operations in a storage system stopped.
Serious failure detected	Operation in a component where a failure occurred stopped.
Moderate failure detected	Partial failure.
Service failure detected	Minor failure.

Chapter 7: SNMP supported MIBs

You can use the SNMP supported MIBs reference to find information on the standard and extension MIB specifications, and trap configuration.

SNMP Agent failure report trap contents

A standard extension trap protocol data unit (PDU) includes the product number of the device that experienced the failure, the device nickname, and a failure reference code. A failure report trap contains additional information about the failure, such as the area, date, and time of the failure.

If you obtain the information with the `GetRequest` command, access the MIB by using the product number of the device as an index.

The following table shows the failure report trap.

Name	Object identifier	Type	Description
eventTrapSerialNumber	.1.3.6.1.4.1.116.5.11.4.2.1	INTEGER	The product number of the device that experienced the failure.
eventTrapNickname	.1.3.6.1.4.1.116.5.11.4.2.2	DisplayString	The nickname of the device where the failure occurred.
eventTrapREFERENCE	.1.3.6.1.4.1.116.5.11.4.2.3	DisplayString	The failure reference code.
eventTrapPartID	.1.3.6.1.4.1.116.5.11.4.2.4	OBJECT IDENTIFIER	The area where the failure occurred.*
eventTrapDate	.1.3.6.1.4.1.116.5.11.4.2.5	DisplayString	Failure occurrence date.
eventTrapTime	.1.3.6.1.4.1.116.5.11.4.2.6	DisplayString	Failure occurrence time.

Name	Object identifier	Type	Description
eventTrapDescription	.1.3.6.1.4.1.116.5.11.4.2.7	DisplayString	Detailed information of a failure.
* The object identifier for a failure in a storage system processor would be .1.3.6.1.4.1.116.5.11.4.1.1.6.1.2.			

SNMP Agent extension trap types

SNMP Agent extension trap types are set according to the severity. The character strings following "RaidEventUser" indicate their severity.

The following table describes the SNMP Agent extension trap types.

Specific Trap Code	Trap	Object Identifier	Description
1	RaidEventUserAccurate	1.3.6.1.4.1.116.3.1 1.4.1.1.0.1	All operations in a storage system stopped.
2	RaidEventUserSerious	1.3.6.1.4.1.116.3.1 1.4.1.1.0.2	Operation in a component where a failure occurred stopped.
3	RaidEventUserModerate	1.3.6.1.4.1.116.3.1 1.4.1.1.0.3	Partial failure.
4	RaidEventUserService	1.3.6.1.4.1.116.3.1 1.4.1.1.0.4	Minor failure.

Standard MIB specifications

MIBs supported by SNMP Agent

SNMP Agent supports a limited number of MIBs. If you send a GET request for an object (MIB) that is not supported, you will receive `NoSuchName` as a GET RESPONSE.

The following table lists MIBs and indicates whether they are supported.

MIB		Supported?
Standard MIB: MIB-II	system group	Yes

MIB mounting specifications supported by SNMP Agent

SNMP Agent supports two MIB mounting specifications.

The supported MIB mounting specifications are as follows:

- mgmt OBJECT IDENTIFIER ::= {iso(1) org(3) dod(6) internet(1) 2 }
- mib-2 OBJECT IDENTIFIER ::= {mgmt 1}

An SNMP Agent mounts only system groups in mib-2, as shown in the following table.

Name	Description	Mounted value
sysObjectID {system 2}	This is the product identification number.	1.3.6.1.4.1.116.3.11.4.1.1 (fixed)
sysUpTime {system 3}	An accumulated time from an SNMP agent.	Unit: 100 ms
sysContact {system 4}	A manager who manages an agent or a contact address.	Maximum 180 characters in an ASCII characters string. Input by a user from an SNMP setting window.*
sysName {system 5}	The name of an agent manager	Maximum 180 characters in an ASCII characters string. Input by a user from an SNMP setting window.*
sysLocation {system 6}	An agent setup location.	Maximum 180 characters in an ASCII characters string. Input by a user from an SNMP setting window.*
sysService {system 7}	Value indicating a service.	Fixed value 76 (decimal)
*The following symbols cannot be used: \ , / ; * ? " < > & % ^		

Extension MIB specifications

Extension MIB configuration

The following shows the extension MIB object system for the storage system.

```
raidExMibRoot (1)
├─raidExMibName (1)      SVP product name
├─raidExMibVersion (2)   SVP Micro-program version
├─raidExMibAgentVersion (3) Extension MIB internal version
├─raidExMibDkcCount (4)  Number of DKC under the control of SVP
├─raidExMibRaidListTable (5) List of DKC under the control of SVP
├─raidExMibDKCHWTable (6) Disk control device information
```

```

└-raidExMibDKUHWTable(7) Disk device information
└-raidExMibTrapListTable(8) Error information list

```

The following figures show an example extension MIB configuration supported by SNMP agents, which list all extension MIBs that can be obtained from storage systems.

```

```

raidExMibName

raidExMibName indicates the SVP product name.

```

raidExMibName          OBJECT-TYPE
SYNTAX                  DisplayString
ACCESS                  read-only
STATUS                  mandatory
DESCRIPTION              "SVP product name."
 ::= { raidExMibRoot 1 }

```

raidExMibVersion

raidExMibVersion indicates the micro-program version.

```

raidExMibVersion        OBJECT-TYPE
SYNTAX                  DisplayString
ACCESS                  read-only
STATUS                  mandatory
DESCRIPTION              "SVP Micro-program version."
 ::= { raidExMibRoot 2 }

```

raidExMibAgentVersion

raidExMibAgentVersion indicates the internal version of the extension MIB.

```

raidExMibAgentVersion OBJECT-TYPE
SYNTAX          DisplayString
ACCESS          read-only
STATUS          mandatory
DESCRIPTION     "Extension agent version."
 ::= { raidExMibRoot 3 }

```

raidExMibDkcCount

raidExMibDkcCount suggests the number of a storage system under the control of the SVP.

```

raidExMibDkcCount      OBJECT TYPE
SYNTAX                 INTEGER
ACCESS                 read-only
STATUS                 mandatory
DESCRIPTION            "Number of DKC which is registered
                       on the SVP"
 ::= { raidExMibRoot 4 }

```

raidExMibRaidListTable

raidExMibRaidListTable indicates the storage system under the control of the SVP.

```

raidExMibRaidListTable OBJECT TYPE
SYNTAX                 SEQUENCE OF raidExMibRaidListEntry
ACCESS                 not-accessible
STATUS                 mandatory
DESCRIPTION            "List of DKC which is registered
                       on the SVP."
 ::= { raidExMibRoot 5 }

raidExMibRaidListEntry OBJECT TYPE
SYNTAX                 RaidExMibRaidListEntry
ACCESS                 not-accessible
STATUS                 mandatory
DESCRIPTION            "Entry of DKC list."
INDEX                  { raidlistSerialNumber }
 ::= { raidExMibRaidListTable 1 }

```

The following table lists the information displayed for each storage system

Name	Type	Description	Mounted value	Attribute
raidlistSerialNumber ::=RaidExMibRaidListEntry(1)	INTEGER	Storage system product number (index).	1 - 99,999	read-only
raidlistMibNickName ::=RaidExMibRaidListEntry(2)	DisplayString	Storage system nickname.	(Max. 18 characters)	read-only
raidlistDKCMainVersion ::=RaidExMibRaidListEntry(3)	DisplayString	Microcode version.	Max. 10 characters	read-only
raidlistDKCProductName ::=RaidExMibRaidListEntry(4)	DisplayString	Storage system product type.	7 characters*	read-only
* VSP5000 will be used as storage system product type raidlistDKCProductName.				

raidExMibDKCHWTable

raidExMibDKCHWTable indicates the status of the storage system components.

```

raidExMibDKCHWTable OBJECT TYPE
SYNTAX                SEQUENCE OF RaidExMibDKCHWEntry
ACCESS                not-accessible
STATUS                mandatory
DESCRIPTION           "Error information of the DKC."
 ::= { raidExMibRoot 6}

raidExMibDKCHWEntry OBJECT TYPE
SYNTAX                RaidExMibDKCHWEntry
ACCESS                not-accessible
STATUS                mandatory
DESCRIPTION           "Entry of DKC information."
INDEX                 {dkcRaidListIndexSerialNumber}
 ::= { raidExMibDKCHWTable 1}

```

The following table lists the information displayed for each storage system component.

Name	Type	Description	MIB value	Attribute
dkcRaidListIndexSerialNumber ::=raidExMibDKCHWEntry(1)	INTEGER	Storage system product number (index).	1 - 99,999	read-only
dkcHWProcessor ::=raidExMibDKCHWEntry(2)	INTEGER	Status of processor.	See Note	read-only
dkcHWCSW ::=raidExMibDKCHWEntry(3)	INTEGER	Status of internal star.	See Note	read-only
dkcHWCache ::=raidExMibDKCHWEntry(4)	INTEGER	Status of cache.	See Note	read-only
dkcHWSM ::=raidExMibDKCHWEntry(5)	INTEGER	Status of shared memory.	See Note	read-only
dkcHWPS ::=raidExMibDKCHWEntry(6)	INTEGER	Status of power supply.	See Note	read-only
dkcHWBattery ::=raidExMibDKCHWEntry(7)	INTEGER	Status of battery.	See Note	read-only
dkcHWFan ::=raidExMibDKCHWEntry(8)	INTEGER	Status of fan.	See Note	read-only
dkcHWEEnvironment ::=raidExMibDKCHWEntry(9)	INTEGER	Information of an operational environment.	See Note	read-only
<p>Note:</p> <p>The status of each component is a single digit which shows the following:</p> <p>1: Normal.</p> <p>2: Acute failure detected.</p> <p>3: Serious failure detected.</p> <p>4: Moderate failure detected.</p>				

Name	Type	Description	MIB value	Attribute
5: Service failure detected.				

raidExMibDKUHWTable

raidExMibDKUHWTable indicates the status of the storage system components.

```

raidExMibDKUHWTable OBJECT TYPE
SYNTAX                SEQUENCE OF RaidExMibDKUHWEntry
ACCESS                not-accessible
STATUS                mandatory
DESCRIPTION           "Error information of the DKU."
 ::= { raidExMibRoot 7 }

raidExMibDKUHWEntry OBJECT TYPE
SYNTAX                RaidExMibDKUHWEntry
ACCESS                not-accessible
STATUS                mandatory
DESCRIPTION           "Entry of DKU information."
INDEX                { dkuRaidListIndexSerialNumber }
 ::= { raidExMibDKUHWTable 1 }

```

The following table lists the information displayed for each disk device component.

Name	Type	Description	MIB value	Attribute
dkuRaidListIndexSerialNumber ::=raidExMibDKUHWEntry(1)	INTEGER	Storage system product number (index).	1 - 99,999	read-only
dkuHWPS ::=raidExMibDKUHWEntry(2)	INTEGER	Status of power supply.	See Note 1.	read-only
dkuHWFan ::=raidExMibDKUHWEntry(3)	INTEGER	Status of fan.	See Note 1.	read-only
dkuHWEEnvironment ::=raidExMibDKUHWEntry(4)	INTEGER	Status of environment monitor. (See Note 2.)	See Note 1.	read-only
dkuHWDDrive ::=raidExMibDKUHWEntry(5)	INTEGER	Status of drive. (See Note 3.)	See Note 1.	read-only
Notes:				

Name	Type	Description	MIB value	Attribute
<ol style="list-style-type: none"> 1. The status of each component is a single digit which shows the following: <ol style="list-style-type: none"> 1. Normal. 2. Acute failure detected. 3. Serious failure detected. 4. Moderate failure detected. 5. Service failure detected. 2. The status of environment monitor indicates the status of drives and ENC's in the drive box, and returns a value indicating the highest failure level. 3. Indicates the drive status in the controller chassis. 				

raidExMibTrapListTable

raidExMibTrapListTable shows the history of the failure traps.

```

raidExMibTrapListTable OBJECT TYPE
SYNTAX SEQUENCE OF RaidExMibTrapListEntry
ACCESS not-accessible
STATUS mandatory
DESCRIPTION "Trap list table."
::={ raidExMibRoot 8 }

raidExMibTrapListEntry OBJECT TYPE
SYNTAX RaidExMibTrapListEntry
ACCESS non-accessible
STATUS mandatory
DESCRIPTION "Trap list table index."
INDEX { eventListIndexSerialNumber ,
eventListIndexRecordNo }
::={ raidExMibTrapListTable 1 }

```

The following table lists the information displayed for each failure.

Name	Type	Description	MIB value	Attribute
eventListIndexSerialNumber ::=raidExMibTrapListEntry(1)	INTEGER	Storage system product number (index).	1 - 99,999	read-only

Name	Type	Description	MIB value	Attribute
eventListNickname ::=raidExMibTrapListEntry (2)	DisplayString	Storage system nickname.	18 characters maximum	read-only
eventListIndexRecordNo ::=raidExMibTrapListEntry (3)	Counter	Number of records.	1-256	read-only
eventListREFCODE ::=raidExMibTrapListEntry (4)	DisplayString	Reference code (index).	6 characters	read-only
eventListData ::=raidExMibTrapListEntry (5)	DisplayString	Date when the failure occurred.	yyyy/mm/dd (10 characters)	read-only
eventListTime ::=raidExMibTrapListEntry (6)	DisplayString	Time when the failure occurred.	hh:mm:ss (8 characters)	read-only
eventListDescription ::=raidExMibTrapListEntry (7)	DisplayString	Detailed information about the failure.	256 characters maximum	read-only

Chapter 8: SIM codes

You can use the failure trap reference to identify trap reference codes (SIM codes) to see what section it affects and the alert levels.

Failure trap reference codes

The following table lists and describes the failure trap reference codes.

For details on alert levels, see the *System Administrator Guide*.

Trap reference code			Description	Section	Alert level	Host report ¹
SIM 22	SIM 23	SIM 13				
14	02	00	Communication error between MP and SVP	SVP failure	MODERATE	Yes
14	20	xx	Transmitted data abnormality between MP and GUM	Processor	MODERATE	Yes
18	00	00	AuditLog lost	DKC environment	MODERATE	Yes
21	20	xx	Channel port blocking	Processor	MODERATE	Yes
21	30	xx	CHB blocking	Environmental error	MODERATE	Yes
21	60	xx	HIE blocking	Cache	MODERATE	Yes
21	61	xx	ISW blocking	Cache	MODERATE	Yes
21	62	xx	X path blocking	Cache	MODERATE	Yes
21	63	xx	HIE warning	Cache	MODERATE	Yes

Trap reference code			Description	Section	Alert level	Host report ¹
SIM 22	SIM 23	SIM 13				
21	64	xx	X path warning	Cache	MODERATE	Yes
21	80	xx	Logical path(s) on the remote copy connections was logically blocked (Due to an error condition)	Processor	MODERATE	Yes ²
21	81	xx	RIO PATH AUTOMATICALLY RECOVERED	Processor	SERVICE	No
21	90	xx	AL_PA VALUE CONFLICT	Processor	SERVICE	No
21	93	xx	LINK FAILURE	Processor	SERIOUS	Yes
21	94	xx	LINK FAILURE2	Processor	SERIOUS	Yes
21	a3	xx	HTP blocking	Processor	MODERATE	Yes
21	a8	xx	SFP wrong type	Processor	MODERATE	No
21	aa	xx	SFP TxFault	Processor	MODERATE	No
21	ab	xx	SFP warning	Processor	MODERATE	Yes
21	ac	xx	SFP alarm	Processor	MODERATE	Yes
21	bx	xx	HTP hard error	Processor	MODERATE	Yes
21	d0	xx	External storage system connection path blocking	Processor	MODERATE	Yes
21	d1	xx	External storage system connection path restore	Processor	SERVICE	No
21	d2	xx	Threshold over by external storage system connection path response time-out	Processor	SERVICE	Yes
21	d4	xx	Blocking the Data Migration path	Processor	MODERATE	No

Trap reference code			Description	Section	Alert level	Host report ¹
SIM 22	SIM 23	SIM 13				
21	d5	xx	Data Migration Path Recovery	Processor	SERVICE	No
30	70	xx	CHK1A THRESHOLD OVER	Processor	SERVICE	No
30	71	xx	CHK1B THRESHOLD OVER	Processor	SERVICE	No
30	72	xx	CHK3 THRESHOLD OVER	Processor	SERVICE	No
30	73	xx	PROCESSOR BLOCKING	Processor	MODERATE	Yes
30	75	xx	FM ERROR	Processor	MODERATE	Yes
30	76	xx	Incorrect SUM value of FM	Processor	SERVICE	No
30	77	xx	PROCESSOR MEMORY TEMPORARY ERROR	Processor	SERVICE	No
30	78	xx	BFM error	Processor	SERIOUS	Yes
30	80	xx	WCHK1 dump	Processor	MODERATE	No
30	a1	00	DKC Blockade	Processor	ACUTE	Yes
38	8f	00	P/S OFF IMPOSSIBLE	PS(DKC)	MODERATE	No
38	9f	00	P/S OFF IMPOSSIBLE(DEVICE RESERVED)	PS(DKC)	MODERATE	No
39	90	xx	Undefined Package is mounted	Processor	MODERATE	No
39	91	xx	V-R OR SERIAL NUMBER IS INCONSISTENT	Processor	MODERATE	No
39	93	xx	REPLACE FAILED	Processor	MODERATE	No
39	9d	xx	Injustice DC voltage control	Processor	MODERATE	Yes
39	9e	xx	Injustice CEMODE	Processor	MODERATE	Yes
39	9f	xx	Injustice CEDT	Processor	MODERATE	Yes

Trap reference code			Description	Section	Alert level	Host report ¹

Legend:

- **Yes:** This SIM performs the host report.
 - **No:** This SIM does not perform the host report.
 - **x:** A hexadecimal number between 0 and f.
1. If you select All for Notification Alert in the **Edit Alert Settings** window, the SNMP agent reports all SIMs. If you select Host Report, the SNMP agent reports only SIMs that perform the host report.
 2. If the DKC emulation type is I-2105 or I-2107, SIMs are reported to the host only if SOM 308 is enabled. However, SOM 308 is disabled by default.
 3. This SIM is not reported to the host, but the SNMP agent reports the SIM when Host Report is selected for Notification Alert in the **Edit Alert Settings** window.
 4. The SNMP agent does not report this SIM when Host Report is selected for Notification Alert in the **Edit Alert Settings** window, because the SIM is reported to the host, but not to the SVP.

Trap reference code			Description	Section	Alert level	Host report ¹
SIM 22	SIM 23	SIM 13				
<p>5. SIMs are not reported to the host by default. To enable reporting of service SIMs, see the <i>Hitachi Universal Replicator for Mainframe User Guide</i>.</p> <p>6. xxx: Drive location. For details, see Converting DB and RDEV numbers to the HDD location number (on page 86).</p> <p>7. If the value that consists of the lower 1 byte of SIM Byte 23 and 2 bytes of SIM Byte 13 is ffe, it means that multiple pools are blocked due to SM volatile.</p>						

Converting DB and RDEV numbers to the HDD location number

To identify the location of an error, convert drive box (DB) and RDEV numbers to the HDD location number.

The following describes the bit alignment of DB and RDEV numbers (which are expressed by 13 bits of a SIM reference code) and the relationship between the DB and RDEV numbers and the HDD location.

- Format of the DB and RDEV numbers

W (4 bits)				X (4 bits)				Y (4 bits)				Z (4 bits)			
w	w	w	w	x	x	x	x	y	y	y	y	z	z	z	z
DB number (8 bits)								RDEV number (5 bits)							

Example:

When SIM code = eb75a5 (Correction access occurred [eb7xxx]):

WXYZ = 75a5 (hexadecimal)

7				5				a				5				
0	1	1	1	0	1	0	1	1	0	1	0	0	0	1	0	1
DB number = AD (hexadecimal)								RDEV number = 05 (hex)								

7	5	a	5
	173 (decimal)		5 (decimal)

- Relationship between the DB and RDEV numbers and the HDD location number

Example:

When *WXYZ* = 75a5 (hexadecimal):

HDD location number: HDD173-05

The following table describes the relationship between the DB and RDEV numbers (13 bits of a reference code), drive box number, RDEV number, and HDD location number, taking the example of drive boxes DB-000, DB-001, DB-190, and DB-191.

Reference code (DB#/RDEV#(hex))	Drive box number (DB#)	RDEV number (R#)	HDD location number
0000	DB-000	00	HDD000-00
0001		01	HDD000-01
0002		02	HDD000-02
0003		03	HDD000-03
0004		04	HDD000-04
0005		05	HDD000-05
0006		06	HDD000-06
0007		07	HDD000-07
0008		08	HDD000-08
0009		09	HDD000-09
000A		10	HDD000-10
000B		11	HDD000-11
0020	DB-001	00	HDD001-00
0021		01	HDD001-01

Reference code (DB#/RDEV#(hex))	Drive box number (DB#)	RDEV number (R#)	HDD location number
0022		02	HDD001-02
0023		03	HDD001-03
0024		04	HDD001-04
0025		05	HDD001-05
0026		06	HDD001-06
0027		07	HDD001-07
0028		08	HDD001-08
0029		09	HDD001-09
002A		10	HDD001-10
002B		11	HDD001-11
...	
17C0	DB-190	00	HDD190-00
17C1		01	HDD190-01
17C2		02	HDD190-02
17C3		03	HDD190-03
17C4		04	HDD190-04

17E3		03	HDD191-03

Reference code (DB#/RDEV#(hex))	Drive box number (DB#)	RDEV number (R#)	HDD location number
17E4		04	HDD191-04
17E5		05	HDD191-05
17E6		06	HDD191-06
17E7		07	HDD191-07
17E8		08	HDD191-08
17E9		09	HDD191-09
17EA		10	HDD191-10
17EB		11	HDD191-11

Glossary

community name

An SNMP entity in which up to 32 names and up to 32 IP addresses can be registered.

extension trap

An error message generated by a third-party node and sent to the SNMP agent.

failure trap

An error message that indicates a problem within a managed node.

IPv4

Internet Protocol, Version 4

IPv6

Internet Protocol, Version 6

managed device

A network node on which the SNMP Agent software is installed. Using the agent, managed devices exchange node-specific information with the SNMP management software.

managed node

See managed device.

management information base (MIB)

A virtual database of objects that can be monitored by a network management system. SNMP uses standardized MIBs that allow any SNMP-based tool to monitor any device defined by a MIB file.

Simple Network Management Protocol (SNMP)

An industry-standard protocol that is used to manage and monitor network-attached devices for conditions that warrant administrative attention. The devices can include disk devices, routers, and hubs. SNMP uses Simple Gateway Management Protocol (SGMP) to manage TCP/IP gateways.

SNMP Agent

Software that is installed on the SVP and responds to queries from SNMP Manager.

SNMP Manager

Software that is installed on the network management station that collects and manages information from SNMP agents installed in the managed devices on the network.

SNMP trap

An event generated by an SNMP agent from the managed resource that communicates an event, such as an error or failure.

user datagram protocol (UDP)

Software that requests data regarding the status of a managed node.
