

Hitachi Virtual Storage Platform 5000 Series svos RF 9.8.3

Hitachi Alert Notification Guide

The Alert Notification feature provides failure monitoring functions (which include monitoring of your storage systems by using SNMP), enabling you to recognize and fix failures in your storage system.

Preface

The Alert Notification feature provides failure monitoring functions (which include monitoring of your storage systems by using SNMP), enabling you to recognize and fix failures in your storage system.

Please read this document carefully to understand how to use this product, and maintain a copy for reference purposes.

Intended audience

This document is intended for system administrators, Hitachi Vantara representatives, and authorized service providers who install, configure, and operate Hitachi Virtual Storage Platform 5000 series storage systems.

Readers of this document should be familiar with the following:

- Data processing and RAID storage systems and their basic functions.
- Hitachi Virtual Storage Platform 5000 series storage systems and the Product Overview.
- The Device Manager Storage Navigator software for the Hitachi Virtual Storage Platform 5000 series, and the System Administrator Guide.

Product version

This document revision applies to the following product versions:

- VSP 5000 series: microcode 90-08-61 or later
- SVOS RF 9.8.3 or later

Release notes

Read the release notes before installing and using this product. They may contain requirements or restrictions that are not fully described in this document or updates or corrections to this document. Release notes are available on the Hitachi Vantara Support Website: <u>https://knowledge.hitachivantara.com/Documents</u>.

Changes in this revision

- Corrected SIM codes.
- Changed the prerequisite for editing alert notification email settings.

Document conventions

This document uses the following typographic conventions:

Convention	Description		
Bold	 Indicates text in a window, including window titles, menus, menu options, buttons, fields, and labels. Example: 		
	Click OK .		
	 Indicates emphasized words in list items. 		
Italic	 Indicates a document title or emphasized words in text. 		
	 Indicates a variable, which is a placeholder for actual text provided by the user or for output by the system. Example: 		
	pairdisplay -g <i>group</i>		
	(For exceptions to this convention for variables, see the entry for angle brackets.)		
Monospace	Indicates text that is displayed on screen or entered by the user. Example: pairdisplay -g oradb		
< > angle	Indicates variables in the following scenarios:		
brackets	 Variables are not clearly separated from the surrounding text or from other variables. Example: 		
	Status- <report-name><file-version>.csv</file-version></report-name>		
	 Variables in headings. 		
[] square brackets	Indicates optional values. Example: [a b] indicates that you can choose a, b, or nothing.		
{ } braces	Indicates required or expected values. Example: { a b } indicates that you must choose either a or b.		
vertical bar	Indicates that you have a choice between two or more options or arguments. Examples:		
	[a b] indicates that you can choose a, b, or nothing.		

Convention	Description
	{ a b } indicates that you must choose either a or b.

This document uses the following icons to draw attention to information:

lcon	Label	Description
È	Note	Calls attention to additional information.
0	Тір	Provides helpful information, guidelines, or suggestions for performing tasks more effectively.
0	Important	Highlights information that is essential to the completion of a task.
	Caution	Warns the user of adverse conditions and/or consequences (for example, disruptive operations, data loss, or a system crash).
	CAUTION	Warns the user of a hazardous situation that, if not avoided, could result in major or minor injury.
	WARNING	Warns the user of a hazardous situation which, if not avoided, could result in death or serious injury.

Conventions for storage capacity values

Physical storage capacity values (for example, disk drive capacity) are calculated based on the following values:

Physical capacity unit	Value
1 kilobyte (KB)	1,000 (10 ³) bytes
1 megabyte (MB)	1,000 KB or 1,000 ² bytes
1 gigabyte (GB)	1,000 MB or 1,000 ³ bytes
1 terabyte (TB)	1,000 GB or 1,000 ⁴ bytes
1 petabyte (PB)	1,000 TB or 1,000 ⁵ bytes
1 exabyte (EB)	1,000 PB or 1,000 ⁶ bytes

Logical capacity values (for example, logical device capacity, cache memory capacity) are calculated based on the following values:

Logical capacity unit	Value
1 block	512 bytes
1 cylinder	Mainframe: 870 KB
	Open-systems:
	 OPEN-V: 960 KB
	 Others: 720 KB
1 KB	1,024 (2 ¹⁰) bytes
1 MB	1,024 KB or 1,024 ² bytes
1 GB	1,024 MB or 1,024 ³ bytes
1 TB	1,024 GB or 1,024 ⁴ bytes
1 PB	1,024 TB or 1,024 ⁵ bytes
1 EB	1,024 PB or 1,024 ⁶ bytes

Accessing product documentation

Product user documentation is available on the Hitachi Vantara Support Website: <u>https://knowledge.hitachivantara.com/Documents</u>. Check this site for the most current documentation, including important updates that may have been made after the release of the product.

Getting help

The <u>Hitachi Vantara Support Website</u> is the destination for technical support of products and solutions sold by Hitachi Vantara. To contact technical support, log on to the Hitachi Vantara Support Website for contact information: <u>https://support.hitachivantara.com/en_us/contact-us.html</u>.

<u>Hitachi Vantara Community</u> is a global online community for Hitachi Vantara customers, partners, independent software vendors, employees, and prospects. It is the destination to get answers, discover insights, and make connections. **Join the conversation today!** Go to <u>community.hitachivantara.com</u>, register, and complete your profile.

Comments

Please send comments to <u>doc.comments@hitachivantara.com</u>. Include the document title and number, including the revision level (for example, -07), and refer to specific sections and paragraphs whenever possible. All comments become the property of Hitachi Vantara LLC.

Thank you!

Chapter 1: Failure monitoring

You can use alert notification email, Syslog, and SNMP for failure monitoring.

Alert notification email

The following example shows an alert notification email that is sent from the storage system to the mail server.

The following table describes the components of an alert notification email.

Component	Item in the example	Description
Title	VSP 5100 Report	<i>product-name-of-the-storage-</i> <i>system</i> Report
Additional information	//RAID900 // VSP ////////////////////////////////////	The information set in <u>Editing alert</u> notification email settings (on page 16) Nothing appears if no information is set.
Date	Date : 20/04/2021	The date when the error occurred
Time	Time : 00:20:00	The time when the error occurred
Hardware identification	Machine : VSP 5100 (serial# 400102)	storage-system-name-set-in- Storage-Navigator(serial# serial- number)
Failure code	RefCode : 7fffff	The reference code that appears in the alert window

Chapter 1: Failure monitoring

Component	Item in the example	Description
Failure detail	Detail: This is Test Report.	Information of failure locations that need maintenance
		Information of a maximum of eight failure locations appears.
		Each information item includes the following items: action code, assumed failure part, and location.

Syslog message

The following examples show Syslog messages that are sent from the storage system to the syslog server.

You can use Hitachi Device Manager - Storage Navigator to select either of the following message formats: RFC3164-compliant or RFC5424-compliant.

For details, see Editing Syslog settings (on page 19)

Syslog file format (RFC3164-compliant)

<149> Jan 24 18:10:30 GUM Storage: 0000001571,Service,H2(Serial#400102),Japan-Tokyo,

1	2	3	4	5	6	7	8
RefCo	le:7FFA00,Syncl	hroniz	ation time	e failure			

9

No.	ltem	Description	
1	Priority	The priority of a syslog message is determined according to the following formula, enclosed by angle brackets (< >):	
		Priority = 8 × Facility + Severity	
		<i>Facility</i> is 18 (fixed).	
		Severity depends on the type of log information:	
		 3: Error (abnormal end) 	
		 4: Warning (partially abnormal end, or an operation was canceled before it could be completed) 	
		 5: Notice (normal end) 	
		For example, if <i>Severity</i> is 3 (Error), <147> is output as the priority value.	

No.	ltem	Description			
2	Date, time ¹	The date and time in the format of " <i>MMM DD HH:MM</i> :SS"			
		 MMM: first three letters of the month (Jan to Dec) 			
		■ <i>DD</i> : date			
		If <i>DD</i> is a single digit (for example, 1), it is displayed as " 1" (with a blank space before "1") and not as "01".			
		• <i>HH</i> : hour			
		<i>MM</i> : minute			
		 SS: second 			
3	Detected location	"SVP" (fixed)			
4	Program name	"Storage" (fixed)			
5	Message identification	The serial number (0000000000 to 4294967295)			
6	Event type	Any of the following event category names. (The event category corresponds to <i>Severity</i> .)			
		Acute			
		<i>Severity</i> is 3 (Error).			
		Serious			
		<i>Severity</i> is 3 (Error).			
		 Moderate 			
		<i>Severity</i> is 4 (Warning).			
		Service			
		Severity is 5 (Notice).			
7	Hardware identification ²	The storage system name and serial number			
8	Related information	The location identification information set in the Syslog tab in the Edit Alert Settings window of Device Manager - Storage Navigator			
9	Detailed	The SIM reference code and failure information that are displayed in the alert window			

1. A date and time being set on SVP are output as log data. If a failure, such as a SVP failure and a LAN failure, occurs in the storage system, the date and time may be output of the accumulated date and time since January 01, 1970.

No.	ltem	Description
	2. While the controller model is being upgraded, information before upgrade might be output. While the controller model is being downgraded, information before downgrade might be output.	

Syslog file format (RFC5424-compliant)

<149>1 2017-0)1-24T18:17:09.0+0	9:00 GUM S		je 0(000001	1572,Service,H2	(Serial#400	102),
1 2	3	4	5	678	9	10	11	
Japan-Tokyo, RefCode:7FFA00, Synchronization time failure								
12		13						

No.	ltem	Description			
1	Priority	The priority of a syslog message is determined according to the following formula, enclosed by angle brackets (< >):			
		Priority = 8 × Facility + Severity			
		<i>Facility</i> is 18 (fixed).			
		Severity depends on the type of log information:			
		 3: Error (abnormal end) 			
		 4: Warning (partially abnormal end, or an operation was canceled before it could be completed) 			
		 5: Notice (normal end) 			
		For example, if <i>Severity</i> is 3 (Error), <147> is output as the priority value.			
2	Version	"1" (fixed)			
3	Date, time ¹	The date, time, and the time difference between UTC (Coordinated Universal Time) and the local time in the format of "YYYY- <i>MM-DD</i> Thh: <i>mm</i> :ss.s±hh: <i>mm</i> "			
		 YYYY: year, MM: month, DD: date 			
		 hh: hour, mm: minute, ss.s: second in one decimal place 			
		 ±hh:mm: hours and minutes of the time difference. "Z" is written instead of "± hh:mm" when there is no time difference between UTC and the local time, such as "2018-12-26T23:06:58.0Z". 			
4	Detected location	"SVP" (fixed)			
5	Program name	"Storage" (fixed)			
6	Process name	"-" (fixed.)			

Chapter 1: Failure monitoring

No.	ltem	Description			
7	Message ID	"-" (fixed.)			
8	Structured data	"-" (fixed.)			
9	Message identification	The serial number (0000000000 to 4294967295)			
10	Event typeAny of the following event category names. (The event corresponds to Severity.)				
		Acute			
		<i>Severity</i> is 3 (Error).			
		Serious			
		<i>Severity</i> is 3 (Error).			
		Moderate			
		<i>Severity</i> is 4 (Warning).			
		Service			
		<i>Severity</i> is 5 (Notice).			
11	Hardware identification ²	The storage system name and serial number			
12	Related information	The location identification information set in the Syslog tab in the Edit Alert Settings window of Device Manager - Storage Navigator			
13	Detailed information	The SIM reference code and failure information that are displayed in the alert window			
Note	Notes:				
 A date and time being set on SVP are output as log data. If a failure, such as a SVP failure and a LAN failure, occurs in the storage system, the date and time may be output of the accumulated date and time since January 01, 1970. 					

2. While the controller model is being upgraded, information before upgrade might be output. While the controller model is being downgraded, information before downgrade might be output.

SNMP

SNMP data is sent from a storage system to the SNMP agent. The following table describes an example of event details that are contained in SNMP data.

Chapter 1: Failure monitoring

Component	Example	Description	
TRAP type	raideventUsermoderate	Failure level	
eventTrapSerialNumber	1	Serial number of the product	
eventTrapNickname	RAID900	Product name	
eventTrapREFCODE	212051	The reference code that appears in the alert window	
eventTrapPartsID	dkcHWProcessor	Failure location	
eventTrapDate	2018/12/21	The date the SNMP Agent received the SNMP data	
eventTrapTime	08:27:50	The time the SNMP Agent received the SNMP data	
eventTrapDescription	"Channel port blocking"	Information of the failure locations that need maintenance	

Chapter 2: Setting alert notification email

By using the Hitachi Device Manager - Storage Navigator, you can manage the alert notificatrion email settings.

Editing alert notification email settings

This topic describes how to specify the email settings necessary to report failure trap reference codes (SIMs).

Before you begin

- You must have the Storage Administrator (Initial Configuration) role to perform this task.
- You must have installed a mail server that supports Simple Mail Transfer Protocol (SMTP). The SVP uses PLAIN or LOGIN of SMTP authentication (SMTP-AUTH) to connect to the mail server. CRAM-MD5 and DIGEST-MD5 of SMTP-AUTH are not supported.
- You must release Port 25 if a firewall is used (because Port 25 is used for communication between the SVP and the mail server).

Procedure

- 1. Display the Device Manager Storage Navigator main window.
- 2. From the Settings menu, select Environmental Setting > Edit Alert Settings.
- 3. For Notification Alert, select one of the following:
 - All (Sends alerts of all SIMs.)
 - Host Report (Sends alerts only of SIMs that report to hosts.)

Alert destinations are common to Syslog, SNMP, and Email.

- 4. Click the Email tab.
- 5. For Mail Notice, select Enable to enable that option.

Chapter 2: Setting alert notification email

- 6. In Email Settings, enter the destination email address and the attribute (To, Cc, Bcc).
 - To add an email address, click **Add** and then specify the email address and attribute in the **Add Address** window.
 - To change an email address and the attribute, select the check box for the email address you want to change, and then click Change. You can change the email address and attribute in the Change Settings window.

You can select multiple email addresses. If you select multiple email addresses, you can change their attributes only.

 To delete email addresses, select the check boxes for the email addresses you want to delete, and then click **Delete**.

Make sure that you specify these settings if Mail Notice is set to Enable.

7. Enter the source email address (required) and the return email address (option).

You can enter up to 255 characters of alphabets, numerals, and symbols (!, #, \$, %, &, `, +, -, *, /, ', ^, {, }, _, and .).

- 8. Enter the information of the email server.
 - Identifier

To specify the host name, select **Identifier** and then enter up to 63 characters of alphabets, numerals, and symbols (! $\$ () ' - _ . @ ~).

IPv4

To specify an IPv4 address, select **IPv4** and then enter four numbers (0 to 255) in the following format:

XXX.XXX.XXX.XXX (Each XXX indicates a number.)

IPv6

To specify an IPv6 address, select **IPv6** and then enter eight hexadecimal numbers (0 to FFFF) in the following format:

```
YYYY:YYYY:YYYY:YYYY:YYYY:YYYY:YYYY (Each YYYY indicates a hexadecimal number.)
```

You can also specify the abbreviated format of IPv6 addresses.

Make sure that you specify these settings if Mail Notice is set to Enable.

9. In **SMTP Authentication**, select **Enable** (to use SMTP authentication) or **Disable** (to not to use SMTP authentication). If you select **Enable**, also enter the account name and password that you use for SMTP authentication.

You can enter up to 255 characters of alphabets, numerals, and symbols (! () -. @ ~).

Make sure that you specify these settings if Mail Notice is set to Enable.

- 10. Click Send Test Email, if necessary, to test the settings.
- **11.** Confirm that you received the test email.
- 12. Click Finish.
- **13.** Confirm the settings in the **Confirm** window, and then enter the task name in **Task Name**.

Chapter 2: Setting alert notification email

14. Click Apply.

The task is registered. If the check box for **Go to tasks window for status** is selected, the **Tasks** window opens.

Chapter 2: Setting alert notification email

Chapter 3: Setting Syslog

By using the Hitachi Device Manager - Storage Navigator, you can manage Syslog settings.

Editing Syslog settings

This topic describes how to specify the Syslog settings necessary to report a failure in the storage system.

Before you begin

- You must have the Storage Administrator (Initial Configuration) role to perform this task.
- You must install a server that supports Syslog.
- You must release the port to be used for sending Syslog data if a firewall is used.
- If you use the new Syslog protocol (TLS1.2/RFC5424), you must specify, for subjectAltName or CommonName in the syslog server certificate, the host name or IP address of the syslog server.
- If you specify the host name of the syslog server as the transfer destination, you must register the host name and domain name of the syslog server in the DNS server.

Procedure

- 1. Display the Device Manager Storage Navigator main window.
- 2. From the Settings menu, select Environmental Setting > Edit Alert Settings.
- 3. For Notification Alert, select one of the following:
 - All (Sends alerts of all SIMs.)
 - Host Report (Sends alerts only of SIMs that report to hosts.)

Alert destinations are common to Syslog, SNMP, and Email.

- 4. Click the Syslog tab.
- 5. For Transfer Protocol, select the protocol you want to use for sending Syslog data.

Chapter 3: Setting Syslog

- 6. To send Syslog data to the primary server, select **Enable** for **Primary Server** and then specify the following items:
 - IP Address/Host Name

Specify the IPv4 address, IPv6 address, or host name of the syslog server to which you want to send syslog data. To specify the host name, select **Identifier** and then enter up to 255 characters of alphabets, numerals, and symbols (! % - . @ _ `~).

- Port Number
- Client Certificate File Name, Password, and Root Certificate File Name

Specify this setting only when **New Syslog Protocol (TLS1.2/RFC5424)** is selected for **Transfer Protocol**.

- 7. To send Syslog data to the alternative server (secondary server), select **Enable** for **Secondary Server** and then specify the following items:
 - IP Address/Host Name
 - Port Number
 - Client Certificate File Name, Password, and Root Certificate File Name

Specify this setting only when **New Syslog Protocol (TLS1.2/RFC5424)** is selected for **Transfer Protocol**.

- **8.** Specify a name you want for **Location Identification Name** to identify the storage system.
- 9. If New Syslog Protocol (TLS1.2/RFC5424) is selected for Transfer Protocol, specify the values for Timeout, Retry Interval, and Number of Retries.
- 10. Click Send Test Message to Syslog Server, if necessary, to test the settings.
- **11.** Confirm that the Syslog server received the log message (detailed data: "RefCode: 7FFFFF, This is Test Report.").
- 12. Click Finish.
- **13.** Confirm the settings in the **Confirm** window, and then enter the task name in **Task Name**.
- 14. Click Apply.

The task is registered. If the check box for **Go to tasks window for status** is selected, the **Tasks** window opens.

Chapter 3: Setting Syslog

Chapter 4: Setting SNMP

By using the Hitachi Device Manager - Storage Navigator, you can manage alert settings, SNMP trap notification, SNMP request authentication, and test SNMP trap reports.

Editing alert settings

This topic describes how to set the Edit Alert Settings.

Caution: Be sure to document your storage system name before this process, because the settings will be cleared when the SVP is replaced.

Before you begin

You must have the Storage Administrator (Initial Configuration) role to perform this task.

For more information, see the System Administrator Guide.

Procedure

- 1. Display the Device Manager Storage Navigator main window.
- 2. From the Settings menu, select Environmental Setting > Edit Alert Settings.
- 3. For Notification Alert, select one of the following:
 - All (Sends alerts of all SIMs.)
 - Host Report (Sends alerts only of SIMs that report to hosts. Alert destinations are common to Syslog, SNMP, and Email.)
- 4. Click the SNMP tab.
- 5. For Extension SNMP, select Enable to enable that option.
- 6. In System Group Information, enter the Storage System Name, Contact, and Location.

Changes made to information here are also reflected in the **Storage System** window in Device Manager - Storage Navigator.

- 7. Click Finish.
- Enter a name for the task in the Confirm window, confirm the settings, and then click Apply.

Managing SNMP trap notification

Use the procedure for the SNMP version you use to set SNMP trap notification. The items to specify are different depending on the SNMP version.

Note:

Required operations on the SNMP Manager after maintenance

If you are using SNMP v3, and authentication and encryption are enabled for traps, the following operations are required on the SNMP Manager after maintenance operations (including replacement of controller boards). If you are asked by maintenance personnel, perform the following operations.

To check whether the SNMP version is SNMP v3, in the maintenance utility, check the setting for SNMP version in the SNMP tab in the **Alert Notifications** window. To check whether authentication or encryption is enabled for traps, check the setting for Sending Trap Setting in the SNMP tab in the **Set Up Alert Notifications** window.

- Restart the SNMP Manager, or reregister the storage systems to be monitored on the SNMP Manager.
- Test trap reports. (See <u>Testing the SNMP trap report (on page 32)</u>.)
- Obtain the trap history in MIB raidExMibTrapListTable from the SNMP Manager, and then perform proper storage management for traps that are not yet confirmed. For details about the format of the trap history, see <u>raidExMibTrapListTable (on page 51)</u>.

Adding trap notification for SNMP v1 and SNMP v2c

This topic describes the procedure to add IP addresses and communities to trap notification for SNMP v1 and SNMP v2c.

Before you begin

You must have the Storage Administrator (Initial Configuration) role to perform this task.

For more information, see the System Administrator Guide

Procedure

- 1. Display the Device Manager Storage Navigator main window.
- 2. From the Settings menu, select Environmental Setting > Edit Alert Settings.
- 3. Click the SNMP tab.
- 4. Under SNMP Agent, select Enable.
- 5. Under SNMP Version, select v1 or v2c.
- 6. Under Registered Sending Trap Settings, click Add.
- 7. In the Add Sending Trap Setting window, under Community, enter a community name or select from the list of existing community names.

You can enter up to 180 alphanumeric characters. The following special characters are not allowed: ", , ;, :, , , *, ?, <, >, $|, /, ^, \&, '$, and &.

Do not use a space either at the beginning or the end.

- 8. Under Send Trap To, perform one or more of the following steps:
 - To enter a new IP address, select **IPv4** or **IPv6**, and then enter the IP address.
 - To use an existing IP address, select from the list of existing IP addresses.
 - To add more than one IP address, click Add IP Address to add additional input fields.
 - To delete an IP address from Send Trap To, click the minus (-) button next to the IP address.
 - Note: Any IP address that has all values set to zero (0) cannot be specified for IPv4 and IPv6. The IPv6 address is specified by entering eight hexadecimal numbers that are separated by colons (:) using a maximum of 4 digits from zero (0) to FFFF inclusive. The default form of the IPv6 address can be specified.
- Click OK. The IP address and community you entered are added to the Registered Sending Trap Settings table.
- 10. Click Finish.
- **11.** In the **Confirm** window, enter a name for the task, confirm the settings, and then click **Apply**.

Adding trap notification for SNMP v3

This topic describes the procedure to add IP addresses and users to trap notification for SNMP v3.

Before you begin

You must have the Storage Administrator (Initial Configuration) role to perform this task.

For more information, see the System Administrator Guide.

Procedure

- 1. Display the Device Manager Storage Navigator main window.
- 2. From the Settings menu, select Environmental Setting > Edit Alert Settings.
- 3. Click the SNMP tab.
- 4. Under SNMP Agent, select Enable.
- 5. Under SNMP Version, select v3.
- 6. Under Registered Sending Trap Settings, click Add.
- 7. In the Add Sending Trap Setting window, under Send Trap To, select IPv4 or IPv6, and enter an IP address.

Note: Any IP address that has all values set to zero (0) cannot be specified for IPv4 and IPv6. The IPv6 address is specified by entering eight hexadecimal numbers that are separated by colons (:) using a maximum of 4 digits from zero (0) to FFFF inclusive. The default form of the IPv6 address can be specified.

8. Under User Name, enter a user name.

You can enter up to 32 alphanumeric characters. The following special characters are not allowed: ", , ;, :, , *, ?, <, >, |, /, ^, &, and %.

Do not use a space either at the beginning or the end.

9. Under Authentication, select whether to Enable or Disable authentication.

If you select **Enable**, complete the following steps:

- a. For **Protocol**, select an authentication type.
- b. For Password, enter a password.
- 10. Under Encryption, select whether to Enable or Disable encryption.

Note: If you select **Disable** for **Authentication**, **Encryption** is automatically disabled.

If you select Enable, complete the following steps:

- a. For **Protocol**, select an encryption type.
- b. For Key, enter a key.
- c. For Re-enter Key, enter the same key for confirmation.
- 11. Click OK.

The IP address and user you entered are added to the **Registered Sending Trap Settings** table.

- 12. Click Finish.
- **13.** In the **Confirm** window, enter a name for the task, confirm the settings, and then click **Apply**.

Changing trap notification for SNMP v1 and SNMP v2c

This topic describes the procedure to change the IP addresses and communities for trap notification for SNMP v1 and SNMP v2c.

Before you begin

You must have the Storage Administrator (Initial Configuration) role to perform this task.

For more information, see the System Administrator Guide.

Procedure

- 1. Display the Device Manager Storage Navigator main window.
- 2. From the Settings menu, select Environmental Setting > Edit Alert Settings.
- 3. Click the SNMP tab.
- 4. Under SNMP Agent, select Enable.
- 5. Under SNMP Version, select v1 or v2c.
- Under Registered Sending Trap Settings, select the trap setting you want to change, and then click Change.
 The Change Sending Trap Setting window opens.

The Change Sending Trap Setting window opens.

7. If you want to change the **Community**, select the **Community** check box, and then enter a community name or select from the list of existing community names.

You can enter up to 180 alphanumeric characters. The following special characters are not allowed: ", , ;, :, , , *, ?, <, >, |, /, , &, ', and &.

Do not use a space either at the beginning or the end.

- **8.** If you want to make changes under **Send Trap to**, select the **Send Trap to** check box, and then perform one or more of the following steps:
 - To enter a new IP address, select IPv4 or IPv6, and then enter the IP address.
 - To use an existing IP address, select from the list of existing IP addresses.
 - To add more than one IP address, click Add IP Address to add additional input fields.
 - To delete an IP address from Send Trap To, click the minus (-) button next to the IP address.

Note: Any IP address that has all values set to zero (0) cannot be specified for IPv4 and IPv6. The IPv6 address is specified by entering eight hexadecimal numbers that are separated by colons (:) using a maximum of 4 digits from zero (0) to FFFF inclusive. The default form of the IPv6 address can be specified.

9. Click OK.

The IP address and community you entered are changed in the **Registered Sending Trap Settings** table.

- **10.** Click **Finish**.
- **11.** In the **Confirm** window, enter a name for the task, confirm the settings, and then click **Apply**.

Changing trap notification for SNMP v3

This topic describes the procedure to change the IP addresses and users for SNMP v3 trap notification.

Before you begin

You must have the Storage Administrator (Initial Configuration) role to perform this task.

For more information, see the System Administrator Guide.

Procedure

- 1. Display the Device Manager Storage Navigator main window.
- 2. From the Settings menu, select Environmental Setting > Edit Alert Settings.
- 3. Click the SNMP tab.
- 4. Under SNMP Agent, select Enable.
- 5. Under SNMP Version, select v3.

6. Under **Registered Sending Trap Settings**, select the trap setting you want to change, and then click **Change**.

The Change Sending Trap Setting window opens.

7. If you want to make changes under **Send Trap to**, select the **Send Trap to** check box, select **IPv4** or **IPv6**, and then enter an IP address.

Note: Any IP address that has all values set to zero (0) cannot be specified for IPv4 and IPv6. The IPv6 address is specified by entering 8 hexadecimal numbers that are separated by colons (:) using a maximum of 4 digits from zero (0) to FFFF inclusive. The default form of the IPv6 address can be specified.

8. If you want to change the User Name, select the User Name check box, and then enter a user name.

You can enter up to 32 alphanumeric characters. The following special characters are not allowed: ", \langle , ;, :, ,, *, ?, <, >, |, /, ^, &, and %.

Do not use a space either at the beginning or the end.

9. If you want to make changes under **Authentication**, select the **Authentication** check box, and then select whether to **Enable** or **Disable** authentication.

If you select Enable, perform the following steps:

- a. To change the **Protocol**, select the **Protocol** check box, and then select an authentication type.
- b. To change the **Password**, select the **Password** check box, and then enter a password.
- **10.** If you want to make changes under **Encryption**, select the **Encryption** check box, and then select whether to **Enable** or **Disable** encryption.
 - **Note:** If you select **Disable** for **Authentication**, **Encryption** is automatically disabled.

If you select **Enable**, perform the following steps:

- a. To change the **Protocol**, select the **Protocol** check box, and then select an encryption type.
- b. To change the **Key**, select the **Key** check box, enter a key, and then enter the key again under **Re-enter Key** for confirmation.
- 11. Click OK.

The IP address and user you entered are changed in the **Registered Sending Trap Settings** table.

- 12. Click Finish.
- **13.** In the **Confirm** window, enter a name for the task, confirm the settings, and then click **Apply**.

Deleting SNMP trap notification

This topic describes the procedure to delete IP addresses and communities or users from SNMP trap notification.

Before you begin

You must have the Storage Administrator (Initial Configuration) role to perform this task.

For more information, see the System Administrator Guide.

Procedure

- 1. Display the Device Manager Storage Navigator main window.
- 2. From the Settings menu, select Environmental Setting > Edit Alert Settings.
- 3. Click the SNMP tab.
- 4. Under SNMP Agent, select Enable.
- 5. Under SNMP Version, select your SNMP version.
- 6. Under **Registered Sending Trap Settings**, select one or more specific combinations of IP address and community or user, and then click **Delete**.
- 7. Click Finish.
- 8. In the **Confirm** window, enter a name for the task, confirm the settings, and then click **Apply**.

Managing SNMP request authentication

Use the procedure for the SNMP version you use to set SNMP request authentication. The items to specify are different depending on the SNMP version.

Adding request authentication for SNMP v1 and SNMP v2c

This topic describes how to add IP addresses and communities for request authentication for SNMP v1 and SNMP v2c.

Before you begin

You must have the Storage Administrator (Initial Configuration) role to perform this task.

For more information, see the System Administrator Guide.

Procedure

- 1. Display the Device Manager Storage Navigator main window.
- 2. From the Settings menu, select Environmental Setting > Edit Alert Settings.
- 3. Click the SNMP tab.
- 4. Under SNMP Agent, select Enable.
- 5. Under SNMP Version, select v1 or v2c.
- 6. Under Registered Request Authentication Settings, click Add.
- 7. In the Add Request Authentication Setting window, under Community, enter a community name or select from the list of existing community names.

You can enter up to 180 alphanumeric characters. The following special characters are not allowed: ", \, ;, :, , , *, ?, <, >, |, /, ^, &, ', and %.

Do not use a space either at the beginning or the end.

- 8. Under Request Permitted, complete one of the following steps:
 - If you want to allow REQUEST operations from all managers, select the All check box.
 - If you want to allow REQUEST operations only from specified managers, perform one or more of the following steps:
 - To enter a new IP address, select IPv4 or IPv6, and then enter the IP address.
 - To use an existing IP address, select from the list of existing IP addresses.

- To add more than one IP address, click **Add IP Address** to add additional input fields.

- To delete an IP address from **Send Trap To**, click the minus (-) button next to the IP address.

Note: Any IP address that has all values set to zero (0) cannot be specified for IPv4 and IPv6. The IPv6 address is specified by entering eight hexadecimal numbers that are separated by colons (:) using a maximum of 4 digits from zero (0) to FFFF inclusive. The default form of the IPv6 address can be specified.

9. Click OK

The community and IP address that you entered are added to the **Registered Request Authentication Settings** table.

- 10. Click Finish.
- **11.** In the **Confirm** window, enter a name for the task, confirm the settings, and then click **Apply**.

Adding request authentication for SNMP v3

This topic describes how to add users for SNMP v3 request authentication.

Before you begin

You must have the Storage Administrator (Initial Configuration) role to perform this task.

For more information, see the System Administrator Guide.

Procedure

- 1. Display the Device Manager Storage Navigator main window.
- 2. From the Settings menu, select Environmental Setting > Edit Alert Settings.
- 3. Click the SNMP tab.
- 4. Under SNMP Agent, select Enable.
- 5. Under SNMP Version, select v3.
- 6. Under Registered Request Authentication Settings, click Add.

7. In the Add Request Authentication Setting window, under User Name, enter a user name.

You can enter up to 32 alphanumeric characters. The following special characters are not allowed: ", $, ;, ;, , *, ?, <, >, |, /, ^, &, and %$.

Do not use a space either at the beginning or the end.

8. Under Authentication, select whether to Enable or Disable authentication.

If you select Enable, complete the following steps:

- a. For **Protocol**, select an authentication type.
- b. For **Password**, enter a password.
- 9. Under Encryption, select whether to Enable or Disable encryption.

Note: If you select **Disable** for **Authentication**, **Encryption** is automatically disabled.

If you select Enable, complete the following steps:

- a. For **Protocol**, select an encryption type.
- b. For Key, enter a key.
- c. For **Re-enter Key**, enter the same key for confirmation.
- **10.** Click **OK**.

The user you entered is added to the **Registered Request Authentication Settings** table.

- 11. Click Finish.
- **12.** In the **Confirm** window, enter a name for the task, confirm the settings, and then click **Apply**.

Changing request authentication for SNMP v1 and SNMP v2c

This topic describes how to change IP addresses and communities for request authentication for SNMP v1 and SNMP v2c.

Before you begin

You must have the Storage Administrator (Initial Configuration) role to perform this task.

For more information, see the System Administrator Guide.

Procedure

- 1. Display the Device Manager Storage Navigator main window.
- 2. From the Settings menu, select Environmental Setting > Edit Alert Settings.
- 3. Click the SNMP tab.
- 4. Under SNMP Agent, select Enable.
- 5. Under SNMP Version, select v1 or v2c.
- 6. Under Registered Request Authentication Settings, select the authentication setting you want to change, and then click Change.

The Change Request Authentication Setting window opens.

7. If you want to make changes under **Community**, select the **Community** check box, and then enter a community name or select from the list of existing community names.

You can enter up to 180 alphanumeric characters. The following special characters are not allowed: ", \langle , ;, :, ,, *, ?, <, >, |, /, ^, &, ', and %.

Do not use a space either at the beginning or the end.

- **8.** If you want to make changes under **Request Permitted**, select the **Request Permitted** check box, and then complete one of the following steps:
 - If you want to allow REQUEST operations from all managers, select the All check box.
 - If you want to allow REQUEST operations only from specified managers, perform one or more of the following steps:
 - To enter a new IP address, select IPv4 or IPv6, and then enter the IP address.
 - To use an existing IP address, select from the list of existing IP addresses.

- To add more than one IP address, click **Add IP Address** to add additional input fields.

- To delete an IP address from **Send Trap To**, click the minus (-) button next to the IP address.

Note: Any IP address that has all values set to zero (0) cannot be specified for IPv4 and IPv6. The IPv6 address is specified by entering 8 hexadecimal numbers that are separated by colons (:) using a maximum of 4 digits from zero (0) to FFFF inclusive. The default form of the IPv6 address can be specified.

9. Click OK.

The community and IP address that you entered are changed in the **Registered Request Authentication Settings** table.

- 10. Click Finish.
- **11.** In the **Confirm** window, enter a name for the task, confirm the settings, and then click **Apply**.

Changing request authentication for SNMP v3

This topic describes how to change users and authentication settings for SNMP v3 request authentication.

Before you begin

You must have the Storage Administrator (Initial Configuration) role to perform this task.

For more information, see the System Administrator Guide.

Procedure

- 1. Display the Device Manager Storage Navigator main window.
- 2. From the Settings menu, select Environmental Setting > Edit Alert Settings.
- 3. Click the SNMP tab.

- 4. Under SNMP Agent, select Enable.
- 5. Under SNMP Version, select v3.
- 6. Under Registered Request Authentication Settings, click Change. The Change Request Authentication Setting window opens.
- 7. If you want to change the User Name, select the User Name check box, and then enter a user name.

You can enter up to 32 alphanumeric characters. The following special characters are not allowed: ", \setminus , ;, :, , *, ?, <, >, |, /, ^, &, and %.

Do not use a space either at the beginning or the end.

8. If you want to make changes under Authentication, select the Authentication check box, and then select whether to Enable or Disable authentication.

If you select Enable, perform the following steps:

- a. To change the **Protocol**, select the **Protocol** check box, and then select an authentication type.
- b. To change the **Password**, select the **Password** check box, and then enter a password.
- **9.** If you want to make changes under **Encryption**, select the **Encryption** check box, and then select whether to **Enable** or **Disable** encryption.

Note: If you select **Disable** for **Authentication**, **Encryption** is automatically disabled.

If you select **Enable**, perform the following steps:

- a. To change the **Protocol**, select the **Protocol** check box, and then select an encryption type.
- b. To change the **Key**, select the **Key** check box, enter a key, and then enter the key again under **Re-enter Key** for confirmation.
- 10. Click OK.

The user you entered is added to the **Registered Request Authentication Settings** table.

- 11. Click Finish.
- **12.** In the **Confirm** window, enter a name for the task, confirm the settings, and then click **Apply**.

Deleting SNMP request authentication

This topic describes how to delete IP addresses and communities or users from request authentication.

Before you begin

You must have the Storage Administrator (Initial Configuration) role to perform this task.

For more information, see the System Administrator Guide.

Procedure

- 1. Display the Device Manager Storage Navigator main window.
- 2. From the Settings menu, select Environmental Setting > Edit Alert Settings.
- 3. Click the SNMP tab.
- 4. Under SNMP Agent, select Enable.
- 5. Under SNMP Version, select your SNMP version.
- 6. Under **Registered Request Authentication Settings**, select one or more specific combinations of IP address and community or user, and then click **Delete**.
- 7. Click Finish.
- 8. In the **Confirm** window, enter a name for the task, confirm the settings, and then click **Apply**.

Testing the SNMP trap report

This topic describes the procedure to test the SNMP trap report.

After you perform this procedure, the test SNMP trap (reference code: 7fffff) is sent to the SNMP Manager registered in the community.

Before you begin

You must have the Storage Administrator (Initial Configuration) role to perform this task.

For more information, see the System Administrator Guide.

Procedure

- 1. Display the Device Manager Storage Navigator main window.
- 2. From the Settings menu, select Environmental Setting > Edit Alert Settings.
- 3. Click the SNMP tab.
- 4. Click Send Test SNMP Trap.

The test SNMP trap is reported to the IP address registered in the storage system. The events registered in the storage system are reported instead of the events that are set on the **SNMP** tab. If you want to test the events set on the **SNMP** tab, click **Finish** and apply the changes to the storage system, and then report the test SNMP trap.

5. Verify that the SNMP trap report (reference code 7fffff) is received by the SNMP manager registered in the community.

Required operations on the SNMP Manager after maintenance

If authentication and encryption are enabled for traps while you are using SNMP v3, the following operations are required on the SNMP Manager after maintenance operations (including SVP replacement, SVP microcode exchange, and SVP failover). If you are asked by maintenance personnel, perform the following operations.

To check the SNMP version and whether authentication and encryption are enabled for traps, see SNMP Version and Sending Trap Setting on the SNMP tab in the **Edit Alert Settings** window in the *System Administrator Guide*.

- Restart the SNMP Manager, or reregister the storage systems to be monitored on the SNMP Manager.
- Test the trap report. (See <u>Testing the SNMP trap report (on page 32)</u>.)
- Obtain the trap history in MIB raidExMibTrapListTable from the SNMP Manager, and then
 perform proper storage management for traps that are not yet confirmed. For details about
 the format of the trap history, see <u>raidExMibTrapListTable (on page 51)</u>.

Chapter 5: Troubleshooting

This chapter provides troubleshooting information for the Hitachi SNMP Agent.

Solving SNMP problems

The following problems can occur:

SNMP security function

If the SNMP security function is working, and a command is executed from an IP address that is not entered, you will get a "no reply" return, and a certification error is received for a trap.

SNMP cold trap function

- Depending on your network environment, you might not receive SNMP agent cold traps when the SVP is rebooted.
- The SNMP agent might report Link up/Link down Trap when the SVP reboots.
- A number of Link up/Link down Traps may be reported when the SVP OS is Windows 7.

Abnormal response to SNMP command

If an error occurs in the SVP, traps might not be sent.

While SVP High Reliability Kit is installed (by maintenance personnel)

- Traps might not be reported for errors that occur during installation.
- SNMP commands might not respond normally.
- Cold traps might be reported repeatedly.
- Traps could be reported to an IP address that is not specified in SNMP settings.

Traps cannot be reported

Perform the following:

- Restart the SNMP Manager, or reregister the storage systems to be monitored on the SNMP Manager.
- Confirm that traps can be reported. (See <u>Testing the SNMP trap report (on page 32)</u>.)
- Obtain the trap history in MIB raidExMibTrapListTable from the SNMP Manager, and then perform proper storage management for traps that are not yet confirmed. For details about the format of the trap history, see <u>raidExMibTrapListTable (on</u> <u>page 51)</u>.

Chapter 5: Troubleshooting

Chapter 6: SNMP overview

This chapter provides an overview of the SNMP implementation for monitoring Hitachi Virtual Storage Platform 5000 series storage systems, including the agent and management functions.

SNMP Manager overview

SNMP Manager is installed in the network management station. It collects and manages information from SNMP agents installed in the managed devices on the network.

The SNMP Manager graphically displays information collected from two or more SNMP agents, accumulates the information in the database, and analyzes problems discovered while accumulating this information.

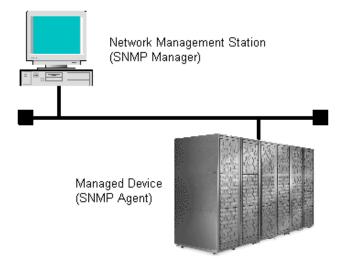

Note:

- SNMP versions v1, v2c, and v3 are supported.
- An RFC-compliant encryption algorithm is adopted for User-based Security Model (USM) authentication.

How SNMP works

Simple Network Management Protocol (SNMP) is an industry-standard protocol for managing and monitoring network devices, including disk devices, routers, and hubs. SNMP uses Simple Gateway Management Protocol (SGMP) to manage TCP/IP gateways.

The following figure shows an example SNMP environment.

Chapter 6: SNMP overview

An SNMP manager monitors the devices, which are referred to as managed nodes. Typically, an SNMP Manager polls the SNMP agents on a periodic basis. The manager receives the reports from the agents and determines whether the devices are operating normally. If an abnormal event occurs, an SNMP Agent can report the condition without a request from the manager, by using a trap message.

When an SNMP manager polls an agent, the following dialogue takes place:

- An SNMP Manager sends a request packet to an SNMP Agent, which requests data regarding the status of the managed node.
- The SNMP Agent sends a response packet back to the SNMP Manager.
- SNMP uses the TCP/IP User Datagram Protocol (UDP). If the SNMP Agent does not respond within a specified time period, the SNMP Manager re-sends the request packet. That time period is set by the system administrator, taking into account the network traffic and operation policy.
- If an SNMP Agent again does not respond to the resent packet, the SNMP Manager assumes that an error has occurred. Depending on the times set for polling and response, this dialogue can take several seconds.

If an SNMP Agent detects an abnormal event, it sends a trap to the SNMP Manager. However, if a trap is dropped in transmission, the SNMP Manager does not know that it was sent. For this reason, you should use both polling and traps to determine whether an abnormal event has occurred.

Management Information Base overview

The standardized configuration and database of network management information is called a Management Information Base (MIB). A standard MIB is common to all SNMP interfaces. An extension MIB is defined by the particular managed device or protocol.

A MIB is a collection of standardized configuration and network management information that is contained in each device on the network. Each MIB contains a set of parameters called managed objects. Each managed object consists of a parameter name, one or more parameters, and a group of operations that can be executed with the object. The MIB defines the type of information that can be obtained from a managed device, and the device settings that can be controlled from a management system.

The MIB definition file, VSP5KMIB.txt, is located in the program\SNMP folder of the software media kit.

SNMP Agent configuration

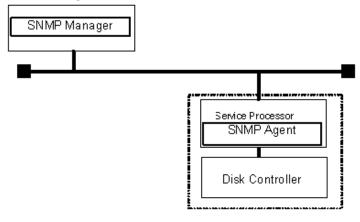

The SNMP Agent is installed on the service processor (SVP), which is the computer within the storage system that manages the storage system.

The storage system has an exclusive LAN for communications with the SVP and a separate LAN for SNMP. The configuration of each Network Management Station is determined by the type of SNMP manager.

The following figure illustrates the SNMP environment.

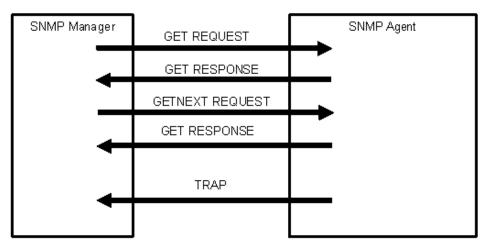

Chapter 6: SNMP overview

Network Management Station

Note: If you cannot enter multiple MIB definition files in the SNMP Manager software, use the MIB definition file for VSP 5000 series. In this case, determine the storage system model by referring to the storage system nickname displayed in an error report.

The following figure shows an example of SNMP operations using an SNMP manager.

SNMP Agent overview

The SNMP Agent is mounted on a managed device (such as a hard disk) in the network. It collects error information, the usage condition, and other information about the device, and sends traps to the SNMP Manager.

The SNMP Agent reports disk storage system failures to the manager using the SNMP trap function.

SNMP traps

An SNMP Agent reports storage system errors to the SNMP Manager using the SNMP trap function.

When an error occurs, the SNMP Agent issues an SNMP trap to the SNMP Manager that includes the product number, nickname, reference code, and an identifier of the component.

The following table lists the types of events that trigger an SNMP Agent trap.

Events	Description	
Acute failure detected.	All operations in a storage system stopped.	
Serious failure detected.	Operation in a component where a failure occurred stopped.	
Moderate failure detected.	Partial failure.	
Service failure detected.	Minor failure.	

An SNMP Agent logs the most recent 10,000 traps, so you can see the trap history of a particular device.

SNMP Agent operations

Operations that an SNMP Agent can perform fall into the categories GET REQUEST, GETNEXT REQUEST, GETBULK REQUEST, and TRAP.

The following table describes the types of SNMP Agent operations.

Operation	Description
GET	Obtains a specific MIB object value.
REQUEST	GET REQUEST is the request from an SNMP Manager, and GET RESPONSE is the agent's response to that request.
GETNEXT	Continuously finds a MIB object.
REQUEST	GETNEXT REQUEST is the request from an SNMP Manager, and GET RESPONSE is the agent's response to that request.
GETBULK	Continuously finds specified MIB objects only.
REQUEST	GETBULK REQUEST is the request from an SNMP Manager, and GET RESPONSE is the agent's response to that request.
TRAP	Reports an event (failure) to an SNMP Manager.
	TRAP occurs without a request from the SNMP Manager.

SNMP Agent reported errors

Several different types of errors can be reported when GET REQUEST, GETNEXT REQUEST, and GETBULK REQUEST operations are sent to an SNMP Agent.

The following table describes the errors that can be reported and suggests corrective action.

Error	Description	Corrective action
noError (0)	Normal	N/A
noSuchName (2)	 There are no MIB objects that are required. (Not supported.) 	Verify that the name of the requested object is correct.
	 The GETNEXT REQUEST command that is specified for the following object identifier of the last supported MIB object is received. 	
	SET REQUEST is received.	SET REQUEST operation is not supported.
genErr (5)	Error occurred for other reasons.	Retry the operation.

Component status information from SNMP Manager

You can obtain the status information of certain storage system components from the SNMP Manager.

The following table lists the components for which the status can be obtained.

Area	Component name
Storage System	Processors
	BUS
	Cache
	Shared memory
	Power supplies
	Batteries
	Fans
	Others
Disk Unit	Power supplies
	Fans
	Environments
	Drives

The following table lists the status of storage system components, as well as the trap report functions.

Status	Description	
Normal	Normal operation.	
Acute failure detected	All operations in a storage system stopped.	
Serious failure detected	Operation in a component where a failure occurred stopped.	
Moderate failure detected	Partial failure.	
Service failure detected	Minor failure.	

Chapter 7: SNMP supported MIBs

You can use the SNMP supported MIBs reference to find information on the standard and extension MIB specifications and trap configuration.

SNMP Agent failure report trap contents

A standard extension trap protocol data unit (PDU) includes the product number of the device that experienced the failure, the device nickname, and a failure reference code. A failure report trap contains additional information about the failure, such as the area, date, and time of the failure.

If you obtain the information with the **GetRequest** command, access the MIB by using the product number of the device as an index.

Name	Object identifier	Туре	Description
eventTrapSerialN umber	.1.3.6.1.4.1.116.5.11.4.2.1	INTEGER	The product number of the device that experienced the failure.
eventTrapNickna me	.1.3.6.1.4.1.116.5.11.4.2.2	DisplayString	The nickname of the device where the failure occurred.
eventTrapREFC ODE	.1.3.6.1.4.1.116.5.11.4.2.3	DisplayString	The failure reference code.
eventTrapPartsI D	.1.3.6.1.4.1.116.5.11.4.2.4	OBJECT IDENTIFIER	The area where the failure occurred.*
eventTrapDate	.1.3.6.1.4.1.116.5.11.4.2.5	DisplayString	Failure occurrence date.
eventTrapTime	.1.3.6.1.4.1.116.5.11.4.2.6	DisplayString	Failure occurrence time.

The following table shows the failure report trap.

Name	Object identifier	Туре	Description
eventTrapDescri ption	.1.3.6.1.4.1.116.5.11.4.2.7	DisplayString	Detailed information of a failure.
* The object identifier for a failure in a storage system processor would be			
.1.3.6.1.4.1.116.5.11.4.1.1.6.1.2.			

SNMP Agent extension trap types

SNMP Agent extension trap types are set according to the severity. The character strings following "RaidEventUser" indicate their severity.

The following table describes the SNMP Agent extension trap types.
--

Specific Trap Code	Тгар	Object Identifier	Description
1	RaidEventUserAcu te	1.3.6.1.4.1.116.3.1 1.4.1.1.0.1	All operations in a storage system stopped.
2	RaidEventUserSeri ous	1.3.6.1.4.1.116.3.1 1.4.1.1.0.2	Operation in a component where a failure occurred stopped.
3	RaidEventUserMo derate	1.3.6.1.4.1.116.3.1 1.4.1.1.0.3	Partial failure.
4	RaidEventUserSer vice	1.3.6.1.4.1.116.3.1 1.4.1.1.0.4	Minor failure.

Standard MIB specifications

MIBs supported by SNMP Agent

SNMP Agent supports a limited number of MIBs. If you send a GET request for an object (MIB) that is not supported, you will receive NoSuchName as a GET RESPONSE.

The following table lists MIBs and indicates whether they are supported.

MIB		Supported?
Standard MIB: MIB-II	system group	Yes

MIB		Supported?
	interface group	No
	at group	No
	ip group	No
	icmp group	No
	tcp group	No
	udp group	No
	egp group	No
	snmp group	No
Extension MIB		Yes

SNMP Agent MIB access mode

The access mode for MIB in all communities is read only. If you send a GET request for a SET REQUEST operation, you will receive <code>NoSuchName</code> as a RESPONSE.

Example object identifier system

The following figure shows an example object system supported by SNMP Agent.

Execute snmpwalk as follows to obtain all MIB objects:

- **1.** Specify object identifier 1.3.6.1.2.1 to obtain the information shown in 1.
- **2.** Specify object identifier 1.3.6.1.4.1.116 to obtain the information shown in 2.

MIB mounting specifications supported by SNMP Agent

SNMP Agent supports two MIB mounting specifications.

The supported MIB mounting specifications are as follows:

- mgmt OBJECT IDENTIFIER ::= {iso(1) org(3) dod(6) internet(1) 2 }
- mib-2 OBJECT IDENTIFIER ::= {mgmt 1}

An SNMP Agent mounts only system groups in mib-2, as shown in the following table.

Name	Description	Mounted value
sysObjectID {system 2}	This is the product identification number.	1.3.6.1.4.1.116.3.11.4.1.1 (fixed)
sysUpTime {system 3}	An accumulated time from an SNMP agent.	Unit: 100 ms
sysContact {system 4}	A manager who manages an agent or a contact address.	Maximum 180 characters in an ASCII characters string. Input by a user from an SNMP setting window.*
sysName {system 5}	The name of an agent manager	Maximum 180 characters in an ASCII characters string. Input by a user from an SNMP setting window.*
sysLocation {system 6}	An agent setup location.	Maximum 180 characters in an ASCII characters string. Input by a user from an SNMP setting window.*
sysService {system 7}	Value indicating a service.	Fixed value 76 (decimal)
*The following	; symbols cannot be used: \ , / : ;	*?"<> &%^

Extension MIB specifications

Extension MIB configuration

The following shows the extension MIB object system for the storage system.

```
raidExMibRoot(1)
-raidExMibName(1) SVP product name
-raidExMibVersion(2) SVP Micro-program version
-raidExMibAgentVersion(3) Extension MIB internal version
-raidExMibDkcCount(4) Number of DKC under the control of SVP
-raidExMibRaidListTable(5) List of DKC under the control of SVP
-raidExMibDKCHWTable(6) Disk control device information
```

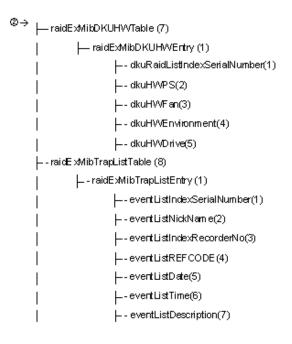

```
-raidExMibDKUHWTable(7) Disk device information
-raidExMibTrapListTable(8) Error information list
```

The following figures show an example extension MIB configuration supported by SNMP agents, which list all extension MIBs that can be obtained from storage systems.

```

                 ->@
```

raidExMibName

raidExMibName indicates the SVP product name.

```
raidExMibName OBJECT-TYPE
SYNTAX DisplayString
ACCESS read-only
STATUS mandatory
DESCRIPTION "SVP product name."
::={ raidExMibRoot 1 }
```

raidExMibVersion

raidExMibVersion indicates the micro-program version.

raidExMibVersion	OBJECT-TYPE
SYNTAX	DisplayString
ACCESS	read-only
STATUS	mandatory
DESCRIPTION	"SVP Micro-program version."
<pre>::= { raidExMibRoot 2 }</pre>	

raidExMibAgentVersion

raidExMibAgentVersion indicates the internal version of the extension MIB.

```
raidExMibAgentVersion OBJECT-TYPE
SYNTAX DisplayString
ACCESS read-only
STATUS mandatory
DESCRIPTION "Extension agent version."
::= { raidExMibRoot 3 }
```

raidExMibDkcCount

 $\tt raidExMibDkcCount$ suggests the number of a storage system under the control of the SVP.

raidExMibDkcCount	OBJECT TYPE
SYNTAX	INTEGER
ACCESS	read-only
STATUS	mandatory
DESCRIPTION	"Number of DKC which is registered
	on the SVP"
::={ raidExMibRoot 4}	

raidExMibRaidListTable

raidExMibRaidListTable indicates the storage system under the control of the SVP.

raidExMibRaidListTable	OBJECT TYPE
SYNTAX	SEQUENCE OF raidExMibRaidListEntry
ACCESS	not-accessible
STATUS	mandatory
DESCRIPTION	"List of DKC which is registered
	on the SVP."
::={ raidExMibRoot 5}	
raidExMibRaidListEntry	OBJECT TYPE
SYNTAX	RaidExMibRaidListEntry
ACCESS	not-accessible
STATUS	mandatory
DESCRIPTION	"Entry of DKC list."
INDEX	{ raidlistSerialNumber }
::={ raidExMibRaidListTa	able 1}

The following table lists the information displayed for each storage system

Name	Туре	Description	Mounted value	Attribute
raidlistSerialNumber ::=RaidExMibRaidListEntr y(1)	INTEGER	Storage system product number (index).	1 - 999,999	read-only
raidlistMibNickName ::=RaidExMibRaidListEntr y(2)	DisplaySt ring	Storage system nickname.	(Max. 18 characters)	read-only
raidlistDKCMainVersion ::=RaidExMibRaidListEntr y(3)	DisplaySt ring	Microcode version.	Max. 10 characters	read-only
raidlistDKCProductName ::=RaidExMibRaidListEntr y(4)	DisplaySt ring	Storage system product type.	7 characters*	read-only
* VSP5000 will be used as s	storage syste	em product type raidlis	stDKCProductNa	ame.

raidExMibDKCHWTable

raidExMibDKCHWTable indicates the status of the storage system components.

```
raidExMibDKCHWTable OBJECT TYPE
SYNTAX SEQUENCE OF RaidExMibDKCHWEntry
ACCESS not-accessible
STATUS mandatory
DESCRIPTION "Error information of the DKC."
::={ raidExMibDKCHWEntry OBJECT TYPE
SYNTAX RaidExMibDKCHWEntry
ACCESS not-accessible
STATUS mandatory
DESCRIPTION "Entry of DKC information."
INDEX {dkcRaidListIndexSerialNumber}
::={ raidExMibDKCHWTable 1}
```

The following table lists the information displayed for each storage system component.

Name	Туре	Description	MIB value	Attribute	
dkcRaidListIndexSerialNu mber	INTEGE R	Storage system product number (index).	1 - 999,999	read-only	
::=raidExMibDKCHWEntr y(1)					
dkcHWProcessor	INTEGE	Status of processor.	See Note	read-only	
::=raidExMibDKCHWEntr y(2)	R				
dkcHWCSW	INTEGE	Status of internal star.	See Note	read-only	
::=raidExMibDKCHWEntr y(3)	R				
dkcHWCache	INTEGE	Status of cache.	See Note	read-only	
::=raidExMibDKCHWEntr y(4)	R				
dkcHWSM	INTEGE	Status of shared	See Note	read-only	
::=raidExMibDKCHWEntr y(5)	R	memory.			
dkcHWPS	INTEGE	Status of power supply.	See Note	read-only	
::=raidExMibDKCHWEntr y(6)	R				
dkcHWBattery	INTEGE	Status of battery.	See Note	read-only	
::=raidExMibDKCHWEntr y(7)	R				
dkcHWFan	INTEGE	Status of fan.	See Note	read-only	
::=raidExMibDKCHWEntr y(8)	R				
dkcHWEnvironment	INTEGE	Information of an	See Note	read-only	
::=raidExMibDKCHWEntr y(9)	R	operational environment.			

Note:

The status of each component is a single digit which shows the following:

1: Normal.

2: Acute failure detected.

3: Serious failure detected.

4: Moderate failure detected.

Name	Туре	Description	MIB value	Attribute
5: Service failure detected.				

raidExMibDKUHWTable

raidExMibDKUHWTable indicates the status of the storage system components.

```
raidExMibDKUHWTable OBJECT TYPE
SYNTAX SEQUENCE OF RaidExMibDKUHWEntry
ACCESS not-accessible
STATUS mandatory
DESCRIPTION "Error information of the DKU."
::={ raidExMibDRoot 7}
raidExMibDKUHWEntry OBJECT TYPE
SYNTAX RaidExMibDKUHWEntry
ACCESS not-accessible
STATUS mandatory
DESCRIPTION "Entry of DKU information."
INDEX { dkuRaidListIndexSerialNumber }
::={ raidExMibDKUHWTable 1}
```

The following table lists the information displayed for each disk device component.

Name	Туре	Description	MIB value	Attribute
dkuRaidListIndexSerialNumb er ::=raidExMibDKUHWEntry(1)	INTEG ER	Storage system product number (index).	1 - 999,999	read-only
dkuHWPS ::=raidExMibDKUHWEntry(2)	INTEG ER	Status of power supply.	See Note 1.	read-only
dkuHWFan ::=raidExMibDKUHWEntry(3)	INTEG ER	Status of fan.	See Note 1.	read-only
dkuHWEnvironment ::=raidExMibDKUHWEntry(4)	INTEG ER	Status of environment monitor. (See Note 2.)	See Note 1.	read-only
dkuHWDrive ::=raidExMibDKUHWEntry(5)	INTEG ER	Status of drive. (See Note 3.)	See Note 1.	read-only
Notes:				

	Name	Туре	Description	MIB value	Attribute
1.	The status of each compo	onent is a	single digit which shows the	following:	
	1. Normal.				
	2. Acute failure detected.				
	3. Serious failure detecte	d.			
	4. Moderate failure detected.				
	5. Service failure detected	d.			
2.	The status of environmen box, and returns a value i		ndicates the status of drives the highest failure level.	and ENCs i	n the drive
3.	Indicates the drive status	in the con	troller chassis.		

raidExMibTrapListTable

raidExMibTrapListTable shows the history of the failure traps.

```
raidExMibTrapListTable OBJECT TYPE
SYNTAX SEQUENCE OF RaidExMibTrapListEntry

SIM 22	SIM 23	SIM 13	Description	Section	Alert level	report 1
ff	fe	xx	Warning for forcible volatile	Cache	MODERA	Yes

Legend:

- Yes: This SIM performs the host report.
- No: This SIM does not perform the host report.
- **x:** A hexadecimal number between 0 and f.
- 1. If you select All for Notification Alert in the **Edit Alert Settings** window, the SNMP agent reports all SIMs. If you select Host Report, the SNMP agent reports only SIMs that perform the host report.
- **2.** If the DKC emulation type is I-2105 or I-2107, SIMs are reported to the host only if SOM 308 is enabled. However, SOM 308 is disabled by default.
- **3.** This SIM is not reported to the host, but the SNMP agent reports the SIM when Host Report is selected for Notification Alert in the **Edit Alert Settings** window.
- 4. The SNMP agent does not report this SIM when Host Report is selected for Notification Alert in the **Edit Alert Settings** window, because the SIM is reported to the host, but not to the SVP.
- **5.** SIMs are not reported to the host by default. To enable reporting of service SIMs, see the *Hitachi Universal Replicator for Mainframe User Guide*.
- **6.** *xxx*: Drive location. For details, see <u>Converting DB and RDEV numbers to the HDD</u> <u>location number (on page 83)</u>.
- **7.** If the value that consists of the lower 1 byte of SIM Byte 23 and 2 bytes of SIM Byte 13 is ffe, it means that multiple pools are blocked due to SM volatile.

Converting DB and RDEV numbers to the HDD location number

To identify the location of an error, convert drive box (DB) and RDEV numbers to the HDD location number.

The following describes the bit alignment of DB and RDEV numbers (which are expressed by 13 bits of a SIM reference code) and the relationship between the DB and RDEV numbers and the HDD location.

Format of the DB and RDEV numbers

W (4 bits)			X (4 bits)				Y (4 bits)			Z (4 bits)					
w	w	w	w	х	х	х	х	у	у	у	у	/ z z z			z
			DB r	numbe	er (8 b	its)					RDE	V nur	nber (5 bits)

Example:

When SIM code = eb75a5 (Correction access occurred [eb7xxx]):

WXYZ = 75a5 (hexadecimal)

7			5			а			5						
0	1	1	1	0	1	0	1	1	0	1	0	0	1	0	1
DB number = AD (hexadecimal)						RDEV number = 05 (hex)									
173			(decimal)					5 (decimal)							

Relationship between the DB and RDEV numbers and the HDD location number

Example:

When *WXYZ* = 75a5 (hexadecimal):

HDD location number: HDD173-05

The following table describes the relationship between the DB and RDEV numbers (13 bits of a reference code), drive box number, RDEV number, and HDD location number, taking the example of drive boxes DB-000, DB-001, DB-190, and DB-191.

Reference code (DB#/RDEV#(hex))	Drive box number (DB#)	RDEV number (R#)	HDD location number
0000	DB-000	00	HDD000-00
0001		01	HDD000-01
0002		02	HDD000-02
0003		03	HDD000-03

Reference code (DB#/RDEV#(hex))	Drive box number (DB#)	RDEV number (R#)	HDD location number
0004		04	HDD000-04
0005		05	HDD000-05
0006		06	HDD000-06
0007		07	HDD000-07
