

Hitachi Virtual Storage Platform G1x00 and F1500

SVOS 7.1

Compatible PAV User Guide

This document describes and provides instructions for using Hitachi Compatible PAV to configure and perform operations on Hitachi Virtual Storage Platform G1000 and G1500, and Virtual Storage Platform F1500 storage systems.

Preface

This document describes and provides instructions for using Hitachi Compatible PAV to configure and perform operations on Hitachi Virtual Storage Platform G1000 and G1500, and Virtual Storage Platform F1500 storage system.

Please read this document carefully to understand how to use these products, and maintain a copy for your reference.

- ☐ [Intended audience](#)
- ☐ [Product version](#)

Intended audience

This document is intended for system administrators, Hitachi Data Systems representatives, and authorized service providers who install, configure, and operate the Hitachi Virtual Storage Platform G1000 and G1500, and Virtual Storage Platform F1500 storage system.

Readers of this document should be familiar with the following:

- Data processing and RAID storage systems and their basic functions.
- The Hitachi Device Manager - Storage Navigator software for Hitachi Virtual Storage Platform G1000 and G1500, and Virtual Storage Platform F1500 and the *System Administrator Guide*.
- The IBM® Parallel Access Volume host software.

Product version

This document revision applies to Hitachi Virtual Storage Platform G1000 and G1500, and Virtual Storage Platform F1500 microcode 80-05-2x or later.

Release notes

Read the release notes before installing and using this product. They may contain requirements or restrictions that are not fully described in this document or updates or corrections to this document. Release notes are available on Hitachi Data Systems Support Connect: <https://knowledge.hds.com/Documents>.

Changes made in this revision

- Hitachi Command Suite lead-in steps were deleted.

Related documents

The documents below are referenced in this document or contain more information about the features described in this document.

Hitachi Virtual Storage Platform G1000 and G1500, and Virtual Storage Platform F1500 documents:

- *Hardware Guide for Hitachi Virtual Storage Platform G1000, G1500, and F1500*, MK-92RD8007
- *System Administrator Guide*, MK-92RD8016
- *Hitachi Device Manager - Storage Navigator Messages*, MK-92RD8017

For a list of all documents for the Hitachi Virtual Storage Platform G1000, see the *Product Overview*.

IBM documentation:

Document conventions

This document uses the following typographic conventions:

Convention	Description
Bold	<ul style="list-style-type: none">• Indicates text in a window, including window titles, menus, menu options, buttons, fields, and labels. Example: Click OK.• Indicates emphasized words in list items.
<i>Italic</i>	<ul style="list-style-type: none">• Indicates a document title or emphasized words in text.• Indicates a variable, which is a placeholder for actual text provided by the user or for output by the system. Example: <code>pairedisplay -g group</code> <p>(For exceptions to this convention for variables, see the entry for angle brackets.)</p>
Monospace	Indicates text that is displayed on screen or entered by the user. Example: <code>pairedisplay -g oradb</code>
< > angle brackets	Indicates variables in the following scenarios: <ul style="list-style-type: none">• Variables are not clearly separated from the surrounding text or from other variables. Example: <code>Status-<report-name><file-version>.csv</code>• Variables in headings.
[] square brackets	Indicates optional values. Example: [a b] indicates that you can choose a, b, or nothing.
{ } braces	Indicates required or expected values. Example: { a b } indicates that you must choose either a or b.
vertical bar	Indicates that you have a choice between two or more options or arguments. Examples: [a b] indicates that you can choose a, b, or nothing. { a b } indicates that you must choose either a or b.

This document uses the following icons to draw attention to information:

Icon	Label	Description
	Note	Calls attention to important or additional information.
	Tip	Provides helpful information, guidelines, or suggestions for performing tasks more effectively.
	Caution	Warns the user of adverse conditions and/or consequences (for example, disruptive operations, data loss, or a system crash).
	WARNING	Warns the user of a hazardous situation which, if not avoided, could result in death or serious injury.

Conventions for storage capacity values

Physical storage capacity values (for example, disk drive capacity) are calculated based on the following values:

Physical capacity unit	Value
1 kilobyte (KB)	1,000 (10^3) bytes
1 megabyte (MB)	1,000 KB or $1,000^2$ bytes
1 gigabyte (GB)	1,000 MB or $1,000^3$ bytes
1 terabyte (TB)	1,000 GB or $1,000^4$ bytes
1 petabyte (PB)	1,000 TB or $1,000^5$ bytes
1 exabyte (EB)	1,000 PB or $1,000^6$ bytes

Logical capacity values (for example, logical device capacity, cache memory capacity) are calculated based on the following values:

Logical capacity unit	Value
1 block	512 bytes
1 cylinder	Mainframe: 870 KB Open-systems: <ul style="list-style-type: none"> • OPEN-V: 960 KB • Others: 720 KB
1 KB	1,024 (2^{10}) bytes
1 MB	1,024 KB or $1,024^2$ bytes
1 GB	1,024 MB or $1,024^3$ bytes
1 TB	1,024 GB or $1,024^4$ bytes
1 PB	1,024 TB or $1,024^5$ bytes

Logical capacity unit	Value
1 EB	1,024 PB or 1,024 ⁶ bytes

Accessing product documentation

Product user documentation is available on Hitachi Data Systems Support Connect: <https://knowledge.hds.com/Documents>. Check this site for the most current documentation, including important updates that may have been made after the release of the product.

Getting help

[Hitachi Data Systems Support Connect](https://support.hds.com/en_us/contact-us.html) is the destination for technical support of products and solutions sold by Hitachi Data Systems. - ☐ [I/O request workflow using Compatible Hyper PAV](#)

About Hitachi Compatible PAV

The Hitachi Compatible PAV (Compatible PAV) feature enables an IBM ® zSeries ® or S/390 ® host system to issue multiple I/O requests in parallel to individual logical devices (LDEVs) in the Hitachi Virtual Storage Platform G1000 and G1500, and Virtual Storage Platform F1500 (VSP G1000 and G1500, and VSP F1500) storage system.

When Compatible PAV is not used, the host system can start only one I/O request to a device at a time, and must wait for the I/O to complete before starting another I/O request to the same device. Compatible PAV enables the host system to start multiple I/O requests to the same device at the same time via alias addresses assigned to a device. When Compatible PAV is used, the host system has substantially faster access to the data stored in the VSP G1000 and G1500, and VSP F1500.

Devices used in Compatible PAV operations

The two device types used in Compatible PAV operations are base devices and alias devices:

- [Base devices on page 14](#)
- [Alias devices on page 15](#)

VSP G1000 and G1500, and VSP F1500 supports up to 256 devices per CU (control unit).

Base and alias devices are defined to the host OS using a combination of HCD/IODF/IOCDS.

Base devices

A base device is an installed and formatted device (for example, 3390-9) that contains user data. A base device must be defined to the host as a "B" device type (for example, 3390B). Base devices are defined by the storage system when the mainframe emulated volumes are defined and installed.

Caution: The following volumes cannot be defined as base devices:

- Journal volumes for Universal Replicator for Mainframe
 - Migration volumes
-

A Cross-OS File Exchange volume is defined as a base, but a Cross-OS File Exchange volume cannot use Compatible PAV.

Related tasks

- [Defining base or alias devices to host operating systems](#) on page 30

Alias devices

An alias device is an LDEV ID (address), where no actual LDEV is defined in the storage system, that can be used with the defined base addresses in the same CU to issue parallel requests to a base address that already has one or more active I/Os in process. Alias devices cannot be varied online. Each alias must be in the same logical CU image as the base device to which it is assigned. An alias device must be defined to the host as an "A" device type (for example, 3390A). To use alias devices, they must be configured in the storage system using Hitachi Command Suite or Hitachi Device Manager - Storage Navigator.

Related tasks

- [Defining base or alias devices to host operating systems](#) on page 30

Compatible PAV modes

Compatible PAV operations can be performed in one of three operational modes (dynamic, static, or Compatible Hyper PAV). The Compatible PAV mode is controlled by the Dynamic alias management parameter setting for the IBM® Workload Manager® (WLM) and the WLMPAV parameter setting in the HCD file.

The VSP G1000 and G1500, and VSP F1500 storage system uses the I-2107 control unit emulation. You can use one of the following modes:

- Dynamic Compatible PAV mode
For more information about this mode, see [Compatible PAV in dynamic mode on page 16](#).
- Static Compatible PAV mode
For more information about this mode, see [Compatible PAV in static mode on page 16](#).
- Compatible Hyper PAV (Hyper PAV) mode
You can specify the PAV feature (Compatible PAV or Compatible Hyper PAV) to use for each host computer. Therefore, an alias device may accept I/O requests from PAV or Hyper PAV.
For more information about this mode, see [Compatible Hyper PAV on page 18](#).

For more information:

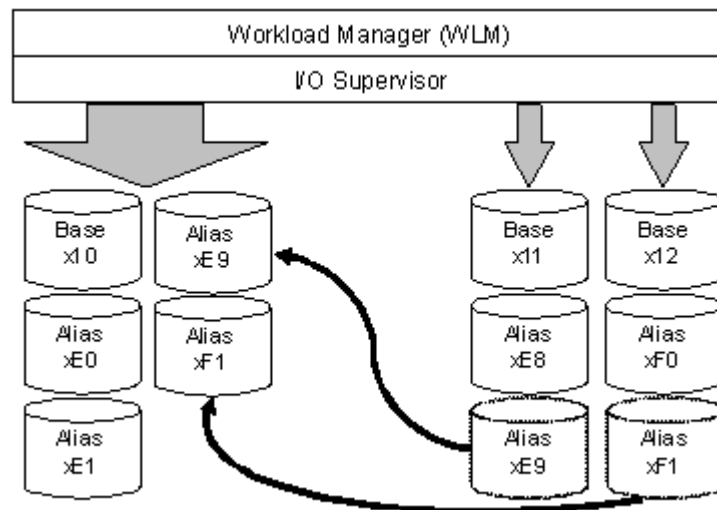

- About WLM, see [Workload Manager on page 17](#) and [Setting the WLM operational mode on page 40](#).
- About the WLMPAV parameter and HCD file, see [Compatible PAV in dynamic mode on page 16](#).

Compatible PAV in dynamic mode

In Compatible PAV dynamic mode, the number of alias devices assigned to each base device may dynamically increase or decrease based on the number of I/O requests to each device. Dynamic mode assists in balancing workloads on base devices and can optimize the speed of accessing data in the VSP G1000 and G1500, and VSP F1500. A dynamic Compatible PAV operation is implemented when the WLM feature for Dynamic alias management setting and the WLMPAV parameter setting in the HCD file are both set to Yes.

For more information about setting the WLM operational mode, see [Setting the WLM operational mode on page 40](#).

In the following figure, the x10, x11, and x12 base devices were originally assigned two alias devices each. In this example, as I/O requests converge on the base device x10 (indicated by the large arrow), the number of alias devices for base device x10 increases to four, while the number of alias devices assigned to the base devices x11 and x12 decreases to one each.

Compatible PAV in static mode

In Compatible PAV static mode, the number of alias devices assigned to each Compatible PAV base device remains the same, even when the number of I/O requests to each device changes.

To use static Compatible PAV, set the WLM operational mode to compatibility mode. The WLM operational mode must be set to compatibility mode to support static Compatible PAV operations. While in compatibility mode, WLM manages the system according to parameters in IPS and ICS (IEAIPSxx and IEAICSxx parmlib members).

For more information about setting the WLM operational mode, see [Setting the WLM operational mode on page 40](#).

The following figure shows an example of Compatible PAV base devices assigned to alias devices.

In this example, the x10, x11 and x12 base devices were originally assigned two alias devices each. As I/O requests converge on the base device x10 (indicated by the large arrow), the number of alias devices for each base device does not change.

Workload Manager

The host computer uses WLM for Compatible PAV. It is a software component of the IBM ® MVS/ESA and z/OS ® operating systems.

WLM supports dynamic and static Compatible PAV operations and manages workloads using one of the following operational modes:

- Goal mode
For more information about this mode, see [WLM in goal mode on page 17](#).
- Compatibility mode
For more information about this mode, see [WLM in compatibility mode on page 17](#).

WLM in goal mode

The WLM must be in goal mode to support dynamic Compatible PAV operations. The WLM is in goal mode when the Dynamic alias management setting in the **WLM Service Coefficient/Service Definition Options** screen is set to Yes. While in goal mode, the WLM manages the system to meet a performance goal.

WLM in compatibility mode

The WLM must be in compatibility mode to support static Compatible PAV operations. The WLM is in compatibility mode when the Dynamic alias

management setting in the **WLM Service Coefficient/Service Definition Options** screen is set to No. While in compatibility mode, the WLM manages the system according to parameters in IPS and ICS (IEAIPSxx and IEAICSxx parmlib members).

Compatible Hyper PAV

You can use the Compatible Hyper PAV feature to map an entire collection of alias devices to a single Compatible PAV base device in a CU and to have all other base devices in the same CU share these aliases.

The Hyper PAV feature does not require that you change the number of alias devices assigned to each base device. With the Compatible Hyper PAV feature, a whole collection of alias devices can be mapped to one base device in a CU when configuring the aliases using Hitachi Device Manager - Storage Navigator in the storage system.

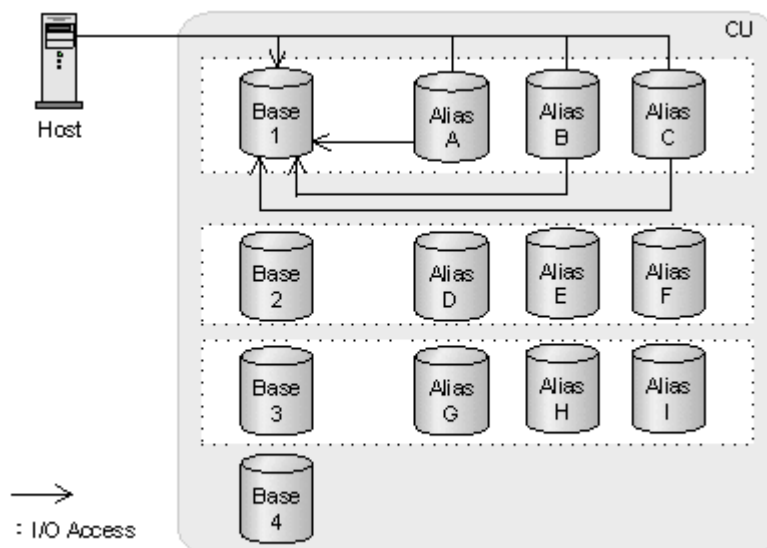

You can specify the PAV feature (Compatible PAV or Compatible Hyper PAV) to use for each host computer. Therefore, an alias device may accept I/O requests from Compatible PAV or Compatible Hyper PAV.

I/O request workflow using Compatible PAV

Multiple alias devices are assigned to a base device in a CU to enable the base device to handle multiple I/O requests.

The existence of defined aliases devices allows the operating system to issue parallel I/Os by issuing I/O to the base address and associated alias addresses for the base device. The maximum number of parallel I/Os is the number of aliases assigned to the base plus 1 for static or dynamic configurations. When Hyper PAV is used, the maximum number of parallel I/Os to a base address is the number of aliases configured in the CU plus 1. If multiple base devices are using aliases, the maximum number for any individual base device is reduced accordingly.

In the following figure, three alias devices are each assigned to base devices 1, 2 and 3.

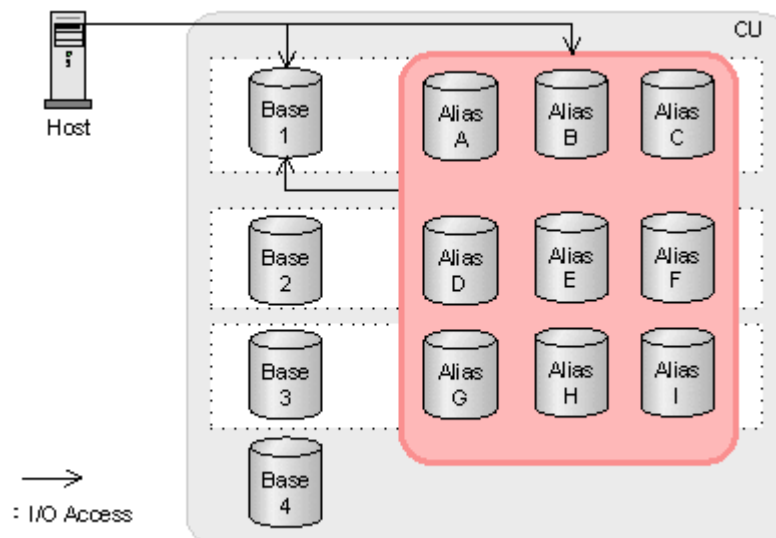

As illustrated with the arrows in the figure, I/O requests converge on base device 1 when a host computer accesses the device using Compatible PAV. Since alias devices A, B, and C were assigned to base device 1 in advance of the operation, I/O requests are automatically issued to these alias devices. Similarly, if a host computer accesses base devices 2 and 3, the I/O requests are automatically issued to the alias devices assigned to those two base devices. Base device 4 is not able to process multiple I/O requests since an alias device is not assigned to the device.

I/O request workflow using Compatible Hyper PAV

Multiple alias devices are assigned to a base device in a CU to enable the base device to handle multiple I/O requests. In Hyper PAV, alias devices are pooled together in each CU. All base devices in the CU share the alias devices as a pool. The aliases are assigned to a specific base address for the duration of the I/O and then returned to the alias pool for the CU.

In the following figure, three alias devices each are assigned to base devices 1, 2, and 3.

As illustrated with the arrows in the figure, I/O requests converge on base device 1 when a host computer accesses the device using PAV. I/O requests are automatically issued to unused alias devices among the nine alias devices in the CU.

Similarly, if a host computer accesses base devices 2, 3, and 4, the I/O requests are automatically issued to unused alias devices among the nine alias devices. Base device 4 can process multiple I/O requests even though an alias device was not specifically assigned to the device when the aliases were configured with Hitachi Device Manager - Storage Navigator.

Requirements and specifications

This topic contains requirements and specifications.

- ☐ [Requirements](#)
- ☐ [Functions incompatible with Compatible PAV](#)
- ☐ [Compatible PAV shared across multiple sysplexes](#)

Requirements

The following table lists the requirements for PAV and Hyper PAV operations.

Item	Requirements	
	PAV	Hyper PAV
Software License Keys	PAV	PAV Hyper PAV
Host OS	<ul style="list-style-type: none"> Dynamic mode: z/VM5.2 with PTF or later Static mode: VM/ESA2.4.0 or later 	z/OS ® 1.8 or later z/OS ® 1.6 with PTF or later z/TPF OS 1.1 with APAR PJ41092 or later z/VM ® 5.3 or later When you use z/VM ®, you must use z/OS ® or z/TPF as a guest OS on z/VM ®.
Controller emulation type	I-2107	I-2107 or I-2107-TPF
Device emulation type for base device	3390-1, 3390-2, 3390-3, 3390-9, 3390-L, 3390-M, 3390-A Cross-OS File Exchange devices listed below are not supported: 3390-3A, 3390-3B, 3390-3C 3390-9A, 3390-9B, 3390-9C, 3390-LA, 3390-LB, 3390-LC 3390-MA, 3390-MB, 3390-MC For z/TPF OS, only the DKU emulation types listed below are supported: 3390-3, 3390-9, 3390-L, 3390-M	
Channel interface	FICON	
Storage system ID setting	One storage system ID for each set of 256 LDEVs	
Maximum number of aliases for one base device	255	
Alias device management	Alias device and its base device must belong to the same logical CU image	
Device Manager - Storage Navigator	PAV and Hyper PAV need the Device Manager - Storage Navigator secondary window. To use the Device Manager - Storage Navigator secondary window, install JRE and set up Java, see the chapter about how to use the Device Manager - Storage Navigator secondary window in the <i>System Administrator Guide</i> .	
Compatible functions	<ul style="list-style-type: none"> Virtual LVI Cache Residency Manager for Mainframe Volume Migration TrueCopy for Mainframe ShadowImage for Mainframe 	

Item	Requirements	
	PAV	Hyper PAV
	<ul style="list-style-type: none"> • Universal Replicator for Mainframe • IBM ® Concurrent Copy (CC) with restrictions • Compatible XRC with restrictions • PPRC • Dynamic Provisioning for Mainframe • Dynamic Tiering for Mainframe • active flash for mainframe <p>For z/TPF OS, only the functions listed below can be used:</p> <ul style="list-style-type: none"> • Virtual LVI • Cache Residency Manager for Mainframe • ShadowImage for Mainframe • TrueCopy for Mainframe • Universal Replicator for Mainframe 	

Functions incompatible with Compatible PAV

Devices using Compatible PAV cannot be used concurrently with the following functions:

- Cross-OS File Exchange
- Open Volume Management
- Cache Residency Manager
- ShadowImage (open system version)
- TrueCopy (open system version)
- Universal Replicator (open system version)
- Global-active device

Devices using Cross-OS File Exchange cannot coexist in the same CU with devices using Compatible PAV.

Compatible PAV shared across multiple sysplexes

You can share Compatible PAV functionality across multiple sysplexes on a storage system.

To share static PAV, all connected systems must be in compatibility mode. To share dynamic PAV, the following requirements and restrictions apply:

- Only one sysplex must be running in Dynamic Alias Management mode. This master sysplex is the only sysplex connected to the storage system that assigns aliases.
- For all other connected sysplexes, set the WLMPAV (HCD) and Dynamic Alias Management (WLM) settings to No.

Note: If you have enabled Dynamic Alias Management for more than one sysplex, unsynchronized alias transition and unpredictable response times may occur.

For more information about setting the WLM mode, [Setting the WLM operational mode on page 40](#).

Defining devices

This topic contains information on selecting base and alias device ratios and procedures on how to use the hardware configuration definition (HCD) software application to define the mapping of devices to LCUs that you have defined to the host systems using Hitachi Device Manager - Storage Navigator.

- ☐ [Unused device addresses usage as alias devices](#)
- ☐ [Defining logical control units](#)
- ☐ [Defining base or alias devices to host operating systems](#)
- ☐ [Finding a device eligible for dynamic Compatible PAV management](#)
- ☐ [Address mapping between base and alias devices](#)

Unused device addresses usage as alias devices

You can use unused device addresses in a CU as aliases for base devices. An optimum base-to-alias device ratio ensures maximum efficiency in processing I/O requests.

Determining an optimum ratio depends on the type of PAV being used as well as the I/O rate for the individual base devices. While some ratios are suggested, the best method is to use a tool that analyzes your RMF data and recommends the appropriate number of aliases to configure for a base address. The best tools will make recommendations for each type of PAV (static, dynamic, and Hyper PAV).

Optimal Compatible PAV results and base-to-alias device ratios

A ratio of 1:3 is recommended as a starting point for each base when using static PAV.

Note: The optimal device ratio will vary based on how often a base device is accessed by the host system.

For example, if you define all 256 devices of a CU to the host system, 64 base devices and 192 alias devices would exist. Three alias devices could be assigned to each base device.

Optimal dynamic PAV results and alias devices

Since dynamic PAV will change alias assignments, it is recommended that you start with a ratio of 1:1 for a CU.

Note: If multiple host systems access devices, you can experience less than optimal results. In this case, use Multiple Allegiance (MA) host software.

Compatible Hyper PAV optimum base/alias device ratio

For Hyper PAV, Hitachi Data Systems recommends between 16 and 32 alias addresses in a CU. These addresses can be assigned to a single base address when performing configuration using Hitachi Device Manager - Storage Navigator. All the aliases in a CU will be placed in a pool and used as required for any base address.

Defining logical control units

You can use the **HCD main** screen to modify and view configuration data.

Before you begin

- The channel paths are defined.
- You are using z/OS ® or z/VM ®.

Procedure

1. From the **ISPF/PDF primary options** menu, select the **HCD** option.
2. On the HCD main screen, for **I/O definition file**, for **Work I/O definition file** (IODF), verify the file is the one you want to use and then select menu item 1, **Define, modify, or view configuration data**.

```
z/OS V1.11 HCD
Command ===> _____

Hardware Configuration

Select one of the following.

1_ 0. Edit profile options
    1. Define, modify, or view configuration data
    2. Activate or process configuration data
    3. Print or compare configuration data
    4. Create or view graphical configuration report
    5. Migrate configuration data
    6. Maintain I/O definition files
    7. Query supported hardware and installed UIMs
    8. Getting started with this dialog
    9. What's new in this release

For options 1 to 5, specify the name of the IODF to be used.

I/O definition file . . . 'SYS1.IODF00.WORK' +
```

3. On the **Define, Modify or View Configuration Data** screen, select menu item 1, **Operating system configurations**.

```
z/OS V1.11 HCD
C          Define, Modify, or View Configuration Data          _

Select type of objects to define, modify, or view data.

Address mapping between base and alias devices

To avoid serious failures that can occur during data processing, complete the following:

- Define the unit address mapping for base and alias devices to the host operating system.
- Match the address mapping defined in the storage system using Hitachi Device Manager - Storage Navigator.

The following figure shows examples of mappings between base devices and alias devices.

```

(A) x 00-x3F:Base   (B) x 00-x3F:Base   (C) x 00-x7F:Alias   (D) x 00-x3F:Alias
    x 40-xFF:Alias  x 40-x7F:Alias     x 80-xFF:Base       x 40-x7F:Base
                                x 80-xBF:Base       x 80-xBF:Alias
                                x C0-xFF:Alias       x C0-xFF:Base

```

Preparing for Compatible PAV operations

This topic describes the operations you must complete to prepare PAV to use with your storage system.

- ☐ [Setting the WLM operational mode](#)
- ☐ [Compatible Hyper PAV enablement from z/OS ® on z/VM ® workflow](#)
- ☐ [MIH timer value setting workflow](#)

Setting the WLM operational mode

The WLM operational mode setting depends on the PAV mode used.

- To use dynamic Compatible PAV, the WLM must be set to goal mode. In goal mode, WLM can assign more or fewer aliases to a base device based on the host I/O activity to that device.
- To use static Compatible PAV, the WLM must be set to compatibility mode. In compatibility mode, the number of aliases assigned to each base device remains the same regardless of host I/O activity to that device.
- To use Compatible Hyper PAV, you do not need to set the WLM operation modes.

Procedure

1. On the WLM startup screen, press **Enter**.
2. On the **Choose Service Definition** screen, select menu item 1, **Read saved definition**, and press **Enter**.

```
File  Help
-----
Command ==>

|                                     |
|               Choose Service Definition               |
|                                     |
|   Select one of the following options.                 |
|   1  1. Read saved definition                         |
|   2  2. Extract definition from WLM                   |

10. Scheduling Environments

4. On the **Service Coefficient/Service Definition Options** screen, complete the following:

- For **Dynamic alias management**, choose the mode.

Values:

- **Yes:** Sets the WLM mode to goal mode. In goal mode, the number of alias devices assigned to each PAV base device can dynamically increase or decrease based on the number of I/O requests to each device.

- **No:** Sets the WLM mode to compatibility mode. In compatibility mode, the number of alias devices assigned to each PAV base device remains the same, even when the number of I/O requests to each device changes.

Default: **Yes**

- For **I/O priority management**, enter a priority. The effect of this field setting depends on the setting for **Dynamic alias management**. The following table shows how the setting of for these items controls whether the Dynamic Alias Algorithm is in effect.

Dynamic Alias Management	I/O Priority Management	Dynamic Alias Algorithm in Effect
No	No	None (static PAV only)
No	Yes	None (static PAV only)
Yes	No	Efficiency only
Yes	Yes	Both efficiency and goal

```

```

5. (If you want to set the WLM to goal mode) In the **WLM View Device Parameter / Feature Definition** screen, verify that **DYNAMIC** and **WLMPAV** are set to **Yes**.

Compatible Hyper PAV enablement from z/OS® on z/VM® workflow

Complete the following process to enable Hyper PAV on z/OS® and z/VM® guest:

Procedure

1. Enable Hyper PAV on z/OS®.
For more information about enabling Hyper PAV on z/OS®, see [Enabling Compatible Hyper PAV on z/OS® on page 42](#)
2. Enable Hyper PAV from z/OS® on z/VM® guest.
For more information about enabling Hyper PAV from z/OS® on z/VM® guest, see [Enabling Compatible Hyper PAV from z/OS® on z/VM® on page 42](#).

Enabling Compatible Hyper PAV on z/OS®

Run the following command from the host system console:

```
SETIOS HYPERPAV=YES
```

An example of the command is shown below:

```
SETIOS HYPERPAV=YES
IOS189I HYPERPAV MODE CHANGE INITIATED - CONTROL UNIT CONVERSION WILL
COMPLETE ASYNCHRONOUSLY
```

Note: You can set the **SETIOS** command for each logical partition (LPAR).

Enabling Compatible Hyper PAV from z/OS® on z/VM®

To enable Hyper PAV from the z/OS® on z/VM®, Hyper PAV must be enabled on z/VM® and z/OS®.

Procedure

1. Run the following command from z/OS® system console to all base devices in the corresponding CU to take those base devices offline:

```
V base_device_number1 base_device_number2,OFFLINE
```

2. Run the following commands from z/VM ® system console to all alias devices that are used for Hyper PAV in the corresponding CU to enable Hyper PAV:

```
DET alias_device_number1-alias_device_number2  
  
VARY OFFLINE alias_device_number1-alias_device_number2  
  
SET CU HYPERPAV ssid1-ssid2  
  
VARY ONLINE alias_device_number1-alias_device_number2  
  
ATT alias_device_number1-alias_device_number2*
```

3. Enable Hyper PAV on the z/OS ® by running the following command from the host system console:

```
SETIOS HYPERPAV=YES
```

4. Run the following command from the system console of z/OS ® to all base devices in the corresponding CU to make those base devices online:

```
V base_device_number1-base_device_number2,ONLINE
```

MIH timer value setting workflow

Set the MIH timer value for PAV operations. You can set the value at any time.

Procedure

1. During IPL, use the MIH parameter in the IECIOSxx parmlib member. Set the MIH timer value in MVS/ESA or z/OS ® to 30 seconds.
2. Run the **SETIOS** system command.

Performing Compatible PAV operations

This topic describes performing PAV operations on the storage system using the GUI.

- ☐ [Assigning alias volumes to base volumes](#)
- ☐ [Deleting alias volumes from base volumes](#)
- ☐ [Assigning alias volumes to different base volumes](#)
- ☐ [Calculating Hitachi Compatible PAV used capacity](#)

Assigning alias volumes to base volumes

You can assign aliases to base volumes in Hitachi Virtual Storage Platform G1000 and G1500, and Virtual Storage Platform F1500. You can assign up to 255 aliases to a base device in a single CU.

Aliases are assigned in the storage system by selecting LDEV addresses that do not have any provisioning (for example, emulated devices such as a 3390-x) assigned to them. These addresses are called free volumes. The list of free volumes is the list of addresses in the CU that can be used as aliases to assign to base volumes. It is important to note that any address that does not have a provisioned device assigned will be on the free volumes list. You must make sure that the free volumes assigned as aliases in Device Manager - Storage Navigator are the corresponding device addresses that are defined as aliases in the IO configuration.

If the number of free volumes you select to assign to the selected base volumes is larger than the number of base volumes you have selected, the PAV function attempts to allocate the free volumes equally to the base volumes. For example, if you select six free volumes and two base volumes, three free volumes (aliases) are allocated to each base volume.

If you are using Hyper PAV to issue I/O requests only to a CU, complete the following:

1. Decide the number of aliases that are necessary for the CU.
2. Assign the aliases to arbitrary base volumes.

Assigned aliases function as aliases for all base volumes in a CU when using Hyper PAV.

Caution: Assigning alias volumes simultaneously in more than one CU can degrade host performance.

Before you begin

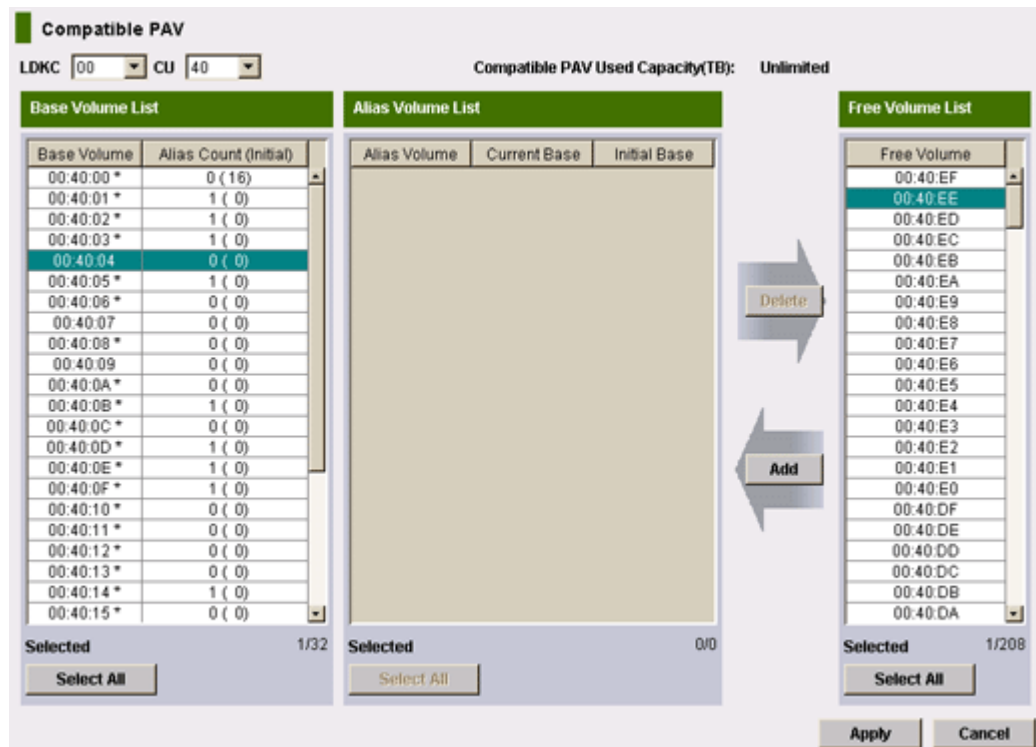

- The PAV and Hyper PAV (if applicable) license keys must be installed in the storage system using Device Manager - Storage Navigator.
- You must have the Storage Administrator (Provisioning) role to perform this task.
- You must enable the Device Manager - Storage Navigator secondary window. For more information, see the chapter about how to use the Device Manager - Storage Navigator secondary window in the *System Administrator Guide*.
- Base devices are defined in the storage system.

Procedure

1. In the Device Manager - Storage Navigator main window, select **Actions > Mainframe Connection > Compatible PAV**.

If you select **Actions** and do not see a **Mainframe Connection** item listed on the drop-down menu, the Device Manager - Storage Navigator secondary window function probably is not enabled.

2. Click  to change to Modify mode.
3. In the **Compatible PAV** window (shown in the following figure), select the LDKC which includes the CU image to be modified from the **LDKC** list.

The screenshot shows the 'Compatible PAV' window. At the top, there are dropdowns for 'LDKC' (set to '00') and 'CU' (set to '40'). To the right, it says 'Compatible PAV Used Capacity(TB): Unlimited'. The window is divided into three main sections: 'Base Volume List', 'Alias Volume List', and 'Free Volume List'.

Base Volume List: A table with two columns: 'Base Volume' and 'Alias Count (Initial)'. It lists 32 entries from '00:40:00*' to '00:40:15*'. The entry '00:40:04*' is selected. At the bottom, it shows 'Selected 1/32' and a 'Select All' button.

Alias Volume List: A table with three columns: 'Alias Volume', 'Current Base', and 'Initial Base'. It is currently empty. At the bottom, it shows 'Selected 0/0' and a 'Select All' button.

Free Volume List: A table with one column: 'Free Volume'. It lists 16 entries from '00:40:EF' to '00:40:DA'. The entry '00:40:EE' is selected. At the bottom, it shows 'Selected 1/208' and a 'Select All' button.

Between the 'Alias Volume List' and 'Free Volume List', there are two arrows: a right-pointing arrow labeled 'Delete' and a left-pointing arrow labeled 'Add'.

At the bottom right of the window are 'Apply' and 'Cancel' buttons.

4. From the **CU** list, select the CU image which contains the desired base volumes.

Base volumes are displayed in **Base Volume List**.

No volumes are displayed if the selected CU image only contains devices to which aliases cannot be assigned, such as 3390-V type devices or any type of open system volume. In these cases, select another CU image.

5. Select one or more base volumes in the **Base Volume List**.
6. Select one or more free volumes in the **Free Volume List**.
7. Click **Add** to assign the selected free volumes to the selected base volumes. The assignments appear in the **Alias Volume List** shown in the following figure.

Deleting alias volumes from base volumes

Alias volumes may be deleted from base volumes using the Compatible PAV window.

Before you begin

- I/O operations are not currently being performed on the base device.

Caution: Deleting alias devices while I/O operations are occurring can cause a serious failure.

- You must have the Storage Administrator (Provisioning) role to perform this task.

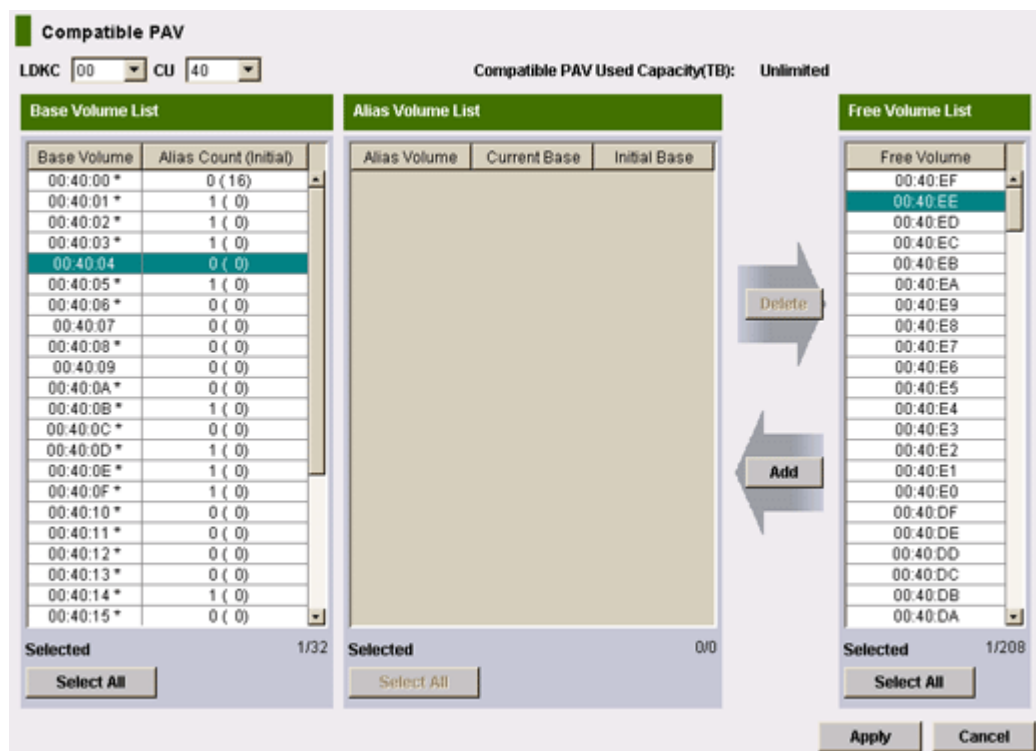

- You must enable the Device Manager - Storage Navigator secondary window. To enable this feature, see the chapter about how to use the Device Manager - Storage Navigator secondary window in the *System Administrator Guide*.

Procedure

- In the Device Manager - Storage Navigator main window, select **Actions > Mainframe Connection > Compatible PAV**.

If you select **Actions** and do not see a **Mainframe Connection** item listed on the drop-down menu, the Device Manager - Storage Navigator secondary window function probably is not enabled.

- Click  to change to Modify mode.
- In the **Compatible PAV** window (shown in the following figure), select the LDKC which includes the CU image to be modified from the **LDKC** list.

The screenshot shows the 'Compatible PAV' window. At the top, there are dropdowns for 'LDKC' (set to '00') and 'CU' (set to '40'). To the right, it says 'Compatible PAV Used Capacity(TB): Unlimited'. The window is divided into three main sections: 'Base Volume List', 'Alias Volume List', and 'Free Volume List'.

Base Volume List: A table with two columns: 'Base Volume' and 'Alias Count (Initial)'. It lists 32 entries from 00:40:00 to 00:40:15. The entry 00:40:04 is selected. Below the table, it shows 'Selected 1/32' and a 'Select All' button.

Alias Volume List: A table with three columns: 'Alias Volume', 'Current Base', and 'Initial Base'. It is currently empty. Below the table, it shows 'Selected 0/0' and a 'Select All' button.

Free Volume List: A table with one column: 'Free Volume'. It lists 16 entries from 00:40:EF to 00:40:DA. The entry 00:40:EE is selected. Below the table, it shows 'Selected 1/208' and a 'Select All' button.

Between the 'Alias Volume List' and 'Free Volume List', there are two large arrows: a right-pointing arrow labeled 'Delete' and a left-pointing arrow labeled 'Add'.

At the bottom right of the window are 'Apply' and 'Cancel' buttons.

- From the **CU** list, select the CU image which contains the aliases to be removed.

Base volumes are displayed in the **Base Volume List**.

No volumes are displayed if the selected CU image only contains devices to which aliases cannot be assigned, such as 3390-V type devices or journal volumes. In these cases, select another CU image.

5. Select one or more base volumes in the **Base Volume List**. Press **Ctrl** and click to select multiple base volumes, press **Shift** and click to select a series of base volumes, or click **Select All** to select all base volumes in the CU image. Alias volumes for each selected base volumes appear in the **Alias Volume List** as shown in the following figure.

The screenshot shows the 'Compatible PAV' window. At the top, there are dropdowns for 'LDKC' (set to 00) and 'CU' (set to 40). To the right, it says 'Compatible PAV Used Capacity(TB): Unlimited'. The window is divided into three main sections:

- Base Volume List:** A table with two columns: 'Base Volume' and 'Alias Count (Initial)'. It lists volumes from 00:40:00* to 00:40:15*. Some rows are highlighted in green, indicating they are selected.
- Alias Volume List:** A table with three columns: 'Alias Volume', 'Current Base', and 'Initial Base'. It shows alias volumes 00:40:20 through 00:40:23, each mapped to a current base (00:40:04 or 00:40:07) and an initial base (00:40:04 or 00:40:07).
- Free Volume List:** A list of free volumes from 00:40:24 to 00:40:39.

Between the Alias Volume List and the Free Volume List, there are 'Delete' and 'Add' buttons with arrows indicating the direction of volume movement. At the bottom of each list, there is a 'Selected' status bar and a 'Select All' button. The bottom of the window has 'Apply' and 'Cancel' buttons.

6. Select one or more alias volumes to remove in the **Alias Volume List**. Press **Ctrl** and click to select multiple alias volumes, Press **Shift** and click to select a series of alias volumes, or click **Select All** to select all alias volumes in the CU image.
7. Once one or more alias volumes are selected, click **Delete** to remove the selected alias volumes from the selected base volumes and move these alias volumes back to the **Free Volume List**.
8. Click **Apply** to apply the changes.

- [Hitachi Compatible PAV window](#) on page 74

Assigning alias volumes to different base volumes

Alias volumes may be manually assigned to a different base volume in the same CU image using the Compatible PAV window. This only applies to static or dynamic Compatible PAV.

Before you begin

- The number of requests to the base volume to which you are moving the alias volume is less than 50 IOPS. Use the Resource Measurement Facility Report Analysis (RMF) or another available software application to get this performance information.

Caution: To avoid a decline in processing performance, do not assign alias volumes to a different base volume if more than 50 IOPS exist.

- You must have Storage Administrator (Provisioning) role to reassign aliases.
- You must enable the Device Manager - Storage Navigator secondary window. For more information, see the chapter about how to use the Device Manager - Storage Navigator secondary window in the *System Administrator Guide*.

Procedure

1. In the Device Manager - Storage Navigator main window, select **Actions > Mainframe Connection > Compatible PAV**.

If you select **Actions** and do not see a **Mainframe Connection** item listed on the drop-down menu, the Device Manager - Storage Navigator secondary window function probably is not enabled.

2. In the **Compatible PAV** window, click  to change to Modify mode, and then complete the following:
 - For **LDKC**, select the LDKC that includes the CU image you want to modify.
 - For **CU**, select the CU image that contains the aliases to be reassigned.
 - For **Base Volume List**, select the base volumes. Alias volumes for each selected base volumes appear in the **Alias Volume List**.
 - For **Alias Volume List**, confirm the alias volumes assigned to the selected base volumes. Select one or more alias volumes to remove and click **Delete** to remove the selected alias volumes from the selected base volumes and move these alias volumes back to the **Free Volume List**.

Select different base volumes. These base volumes can be in the same CU image. Or you can change the CU image using the **LDKC** and **CU** lists.

When one or more new base volumes are selected in the **Base Volume List** and one or more free volumes are selected in the **Free Volume List**, click **Add** to assign the selected free volumes to the selected base volumes. The assignments appear in the **Alias Volume List**.

3. Click **Apply** to apply the changes.

- [Hitachi Compatible PAV window](#) on page 74

Calculating Hitachi Compatible PAV used capacity

The storage system recalculates the PAV used capacity after any PAV operation, such as:

1. Adding aliases to a base volume that has no aliases assigned.
2. Removing all aliases from a base volume or an entire CU.

Note: A base volume without assigned aliases is not counted as part of the used capacity.

3. Uninstalling base volumes using LVI or Universal Volume Manager.
4. Assigning the first alias to a base volume by Dynamic PAV or Hyper PAV.

The calculated used capacity is the total of the following:

- Base volume capacity that aliases are assigned to using Device Manager - Storage Navigator.
- Base volumes which are accessed with alias volumes using Dynamic PAV or Hyper PAV.

The calculation of the used capacity can be time-consuming as it takes three minutes for each CU to calculate this value. If all 255 CUs have volumes, it can take up to 13 hours to calculate and display the updated used capacity. During calculation, the latest value for the used capacity is unavailable. All volumes defined to storage system are calculated. After the calculation has finished, the brackets disappear and the latest value of the used capacity is displayed.

Verifying the device definitions

Use this task to verify that the host recognizes the devices as specified.

Procedure

1. Run the **MVS DEVSERV QPAV** command, using the following syntax:

```
DS QPAV, device_unit_ID, VOLUME
```

Information about the base device and corresponding alias addresses are shown.

The following is sample output of this command on a PAV device.

```
DS QPAV, D222, VOLUME

05000        00          BASE-H
*****      1 DEVICE(S) MET THE SELECTION CRITERIA
```

CONFIGURATION					SUBSYSTEM CONFIGURATION	
UNIT	UA	TYPE	STATUS	SSID	UNIT ADDR	UA TYPE
---	--	---	-	---	---	---
05000	00	BASE-H		5150	00	BASE

Note: The relationship between base and alias devices does not appear as fixed to the operating system when using Hyper PAV. Therefore, only the information about base devices is shown.

2. Verify that the information shown matches the base and alias device definitions displayed by Device Manager - Storage Navigator.

Note: When using Dynamic PAV, the assignments may be different from what you assigned using Device Manager - Storage Navigator. This is because the WLM changes the assignments based on workload and goals. In such a situation, this is normal and does not cause issues.

Verifying the status of devices per channel path

Use this task to verify the status of the devices for each CHP.

Procedure

1. For each CHP ID connected to the storage system, run the following command:

MVS Display Matrix

Using the following syntax:

```
D M=CHP (CHP_ID)
```

The following figure shows a sample output of this command.

```
D M=CHP(80)
IEE174I 10.05.24 DISPLAY M 779
CHPID 80:TYPE=05, DESC=ESCON SWITCHED POINT TO POINT
DEVICE STATUS FOR CHANNEL PATH 80

```

2. Verify that the information shown by running the command matches the device status that you defined when you created the IO configuration definition using HCD. If the information shown is incorrect, redefine the devices to the host operating system.

For more information about redefining devices to host operating systems, see [Defining base or alias devices to host operating systems on page 30](#).

Verifying Compatible Hyper PAV aliases from z/OS ®

Procedure

1. On the host computer, enable the **Compatible Hyper PAV** option.
`SETIOS HYPERPAV=YES`
2. Run the `DEVSERV QPAV` command from the host.
For more information about the proper syntax and an example of this command, see [DEVSERV QPAV commands on page 59](#).
3. Verify that the aliases that are shown are those assigned for Hyper PAV.
 - If the correct aliases for Hyper PAV are not shown, and the host only accesses the one VSP G1000 and G1500, and VSP F1500 system, perform the following:
 - Disable the **Compatible Hyper PAV** option on the host computer.
 - Enable the option again.
 - If the host accesses multiple storage systems that use Hyper PAV, run the following commands from the host to all base devices in the corresponding CU:
`V base_device_number1-base_device_number2,OFFLINE`
`CF CHP(channel_path1-channel_path2),OFFLINE`
`CF CHP(channel_path1-channel_path2),ONLINE`
`V base_device_number1-base_device_number2,ONLINE`
4. If you are using Cross-OS File Exchange on the host computer, run the following commands:
`V Cross_OS_File_Exchange_Volume_1-Cross_OS_File_Exchange_Volume_2,OFFLINE`
`V Cross_OS_File_Exchange_Volume_1-Cross_OS_File_Exchange_Volume_2,ONLINE`
5. Run the `DEVSERV QPAV` command.
6. Check the alias devices in the returned results.

Verifying Compatible Hyper PAV aliases from z/OS ® on z/VM ®

If you restart the VSP G1000 and G1500, and VSP F1500 while using Hyper PAV, verify that the correct aliases on a z/OS ® system that is a guest operating system on z/VM ® are still configured for the CU.

Procedure

1. Enable the **Compatible Hyper PAV** option on z/VM ® and z/OS ®.

2. Run the **QUERY PAV** command from z/VM ®.
For proper syntax and an example of this command, see [QUERY PAV command on page 64](#).
3. Verify that the displayed aliases are those assigned for Hyper PAV.
4. Run the **DEVSERV QPAV** command from z/OS ®.
For proper syntax and an example of this command, see [DEVSERV QPAV commands on page 59](#).
5. Verify that the displayed aliases are those assigned for Hyper PAV.
6. If the correct aliases for Hyper PAV are not shown, run the following commands:
QUERY PAV

DEVSERV QPAV
7. If the host only accesses one VSP G1000 and G1500, and VSP F1500, disable the **Compatible Hyper PAV** option on the host computer, and then enable the option again.
8. If the host accesses other storage systems that use Hyper PAV, complete the following:
 - a. Run the following command from z/OS ® which is used as a guest operating system on z/VM ® to all base devices in the corresponding CU:

```
V base_device_number1-base_device_number2,OFFLINE
```
 - b. Run the commands from z/VM ® to all base devices and alias devices used for Hyper PAV in the corresponding CU. For details about the commands, see [Sample of commands run to all base devices and alias devices from z/VM ® on page 57](#).
 - c. Run the following command from z/OS ® to all base devices in the corresponding CU.

```
V base_device_number1 - base_device_number2,ONLINE
```
 - d. Run the following command from z/OS ® to all channel paths configured on the corresponding CU. You must run this command for each channel path.

```
V PATH(base_device_number1-  
base_device_number2,channel_path),ONLINE
```
9. Run the **DEVSERV QPAV** command.
10. Check for the alias devices in the returned results.

Sample of commands run to all base devices and alias devices from z/VM ®

To verify the aliases of Compatible Hyper PAV from z/OS ® on z/VM ®, if the host accesses other storage systems that use Hyper PAV, run the following

commands from z/VM ® to all base devices and alias devices used for Hyper PAV in the corresponding CU.

Procedure

1. DET *alias_device_number1*-*alias_device_number2*
2. DET *base_device_number1*-*base_device_number2*
3. VARY OFFLINE *alias_device_number1*-*alias_device_number2*
4. VARY OFFLINE *base_device_number1*-*base_device_number2*
5. VARY OFFLINE CHPID *channel_path1*
6. VARY OFFLINE CHPID *channel_path2*
7. VARY ONLINE CHPID *channel_path1*
8. VARY ONLINE CHPID *channel_path2*
9. VARY ONLINE *base_device_number1*-*base_device_number2*
10. VARY ONLINE *alias_device_number1*-*alias_device_number2*
11. ATT *base_device_number1*-*base_device_number2**
12. ATT *alias_device_number1*-*alias_device_number2**

MVS ® commands to monitor Compatible PAV

Use MVS ® commands to monitor the PAV activities on the VSP G1000 and G1500, and VSP F1500 from z/OS ®.

DISPLAY command

The MVS ® **DISPLAY** command shows path information and alias count for the specified base device.

Run this command using the following syntax:

```
D M=DEV(device_unit_ID)
```

The following figure shows a sample output of this command for a PAV base device with six aliases.

```
D M=DEV(8300)
IEE174I 15.33.58 DISPLAY M 739
DEVICE 8300 STATUS=ONLINE

```

DEVSERV QPAV commands

You can use the **MVS DEVSERV QPAV** commands to complete the following operations:

- Show the status of PAV base devices.
For more information about showing the status of PAV base devices, see [Showing the PAV base device status on page 60](#).
- Show the status of a Hyper PAV base device and its alias devices.
For more information about showing the status of Hyper PAV base devices and its alias devices, see [Showing the status of Hyper PAV base devices and alias devices on page 60](#).
- Show the SSID status.
For more information about showing the status of an SSID, see [Showing the SSID status on page 61](#).

- Show the status of the host and subsystem configuration.
For more information about showing the host and subsystem configuration status, see [Showing the host and subsystem configuration status on page 62](#).

Showing the PAV base device status

Use this task to the status of PAV base devices.

Run this command using the following syntax:

```
DS QP,device_unit_ID,4
```

The following figure shows a sample output of this command.

```
DS QP,8300,4
IEE459I 15.50.16 DEVSERV QPAVS 013

DISPLAY IOS HYPERPAV command

The MVS ® **DISPLAY IOS HYPERPAV** command shows the current HYPERPAV enablement status.

Run this command using the following syntax:

```
D IOS,HYPERPAV
```

The following figure shows a sample output of this command.

```
D IOS,HYPERPAV
IOS098I 22.31.34 HYPERPAV DATA 776
HYPERPAV MODE IS SET TO YES
```

GTF I/O tracing

PAV is compatible with GTF I/O tracing. When a device number is specified for a GTF I/O tracing operation, GTF determines if the device is a PAV base device and automatically includes the alias addresses currently assigned to the base device.

VM CP commands for z/VM ®

You can use VM CP commands to monitor the PAV activities on the VSP G1000 and G1500, and VSP F1500 from z/VM ®.

The following syntax conventions are used for VM CP commands:

- **Bold and capitalized characters:** Indicate characters that must be entered.
- **Lowercase characters:** indicate characters that you can omit.
- *italic characters:* Indicate a type of operand. An arbitrary value that you can enter.
- **brackets ([]):** Indicate an operand that you can omit.
- **braces { }:** Indicate that you must select an operand from the list of operands enclosed by the braces.

Note: Delimit operands enclosed within the braces using vertical bars (|).

QUERY CU command

The **QUERY CU** command shows information about DASD CU.

Run this command using the following syntax:

```
Q CU [DASD] {ssid | ssid1 | ssid2} {ALiases | DEVices | PAVMode}
```

The following figure shows a sample output of this command.

```
q cu dasd b600 ali

A0D0 A0D1 A0D2 A0D3 A0D4 A0D5 A0D6 A0D7
A0D8 A0D9 A0DA A0DB A0DC A0DD A0DE A0DF
A0E0 A0E1 A0E2 A0E3 A0E4 A0E5 A0E6 A0E7
A0E8 A0E9 A0EA A0EB A0EC A0ED A0EE A0EF
A0F0 A0F1 A0F2 A0F3 A0F4 A0F5 A0F6 A0F7
A0F8 A0F9 A0FA A0FB A0FC A0FD A0FE A0FF
```

Note: You can only run **QUERY CU** on the z/VM ® instance that is directly connected to the LPAR. Attempting to run this command on z/VM ® that is operating as a guest operating system on another z/VM ® causes the command to be rejected.

QUERY DASD DETAILS command

The **QUERY DASD DETAILS** command shows information about DASD (RDEV).

Run this command using the following syntax:

```
Query DAsd DETAILS {rdev | rdev1 - rdev2}
```

The following figure shows a sample output of this command.

```
q dasd details a000
A000 CUTYPE = 2107-E8, DEVTYPE = 3390-0A, VOLSER = CMA000, CYLS = 3339
    CACHE DETAILS:  CACHE NVS CFW DFW PINNED CONCOPY
                    -SUBSYSTEM  Y   Y   Y   -   N       N
                    -DEVICE    Y   -   -   Y   N       N
    DEVICE DETAILS:  CCA = 00, DDC = --
    DUPLEX DETAILS:  --
    HYPERPAV DETAILS: BASE VOLUME IN POOL 0
    CU DETAILS:      SSID = B600, CUNUM = A000
```

QUERY PAV command

Use the **QUERY PAV** command to show the list of PAV or Hyper PAV devices (including information on those devices) that are managed by the corresponding storage system.

Run this command using the following syntax:

```
Query PAV {rdev | rdev1 - rdev2 | ALL}
```

The following figure shows a sample output of this command.

```
q pav a000
Device A000 is a base HyperParallel Access Volume device in Pool 0
```

QUERY VIRTUAL DASD DETAILS command

Use the **QUERY VIRTUAL DASD DETAILS** command to show information about all DASDs that z/VM ® can access.

Run this command using the following syntax:

```
Query Virtual DAsd [DETAILS]
```

The following figure shows a sample output of this command.

```
Q V DASD details
.
.
.
DASD 1000 3390 CMA000 R/W      3339 CYL ON DASD  A000 SUBCHANNEL = 005D
      HYPERPAVBASE(0)
DASD 3000 3390      R/W      1 CYL ON DASD  A0C0 SUBCHANNEL = 005F
      HYPERPAVALIAS(A0C0,0)
DASD A001 ON DASD  A001 R/W CMA001 SUBCHANNEL = 005E
      DEVCTL HYPERPAVBASE(0)
```

Caution: The DETAILS operand is only valid for dedicated DASD and mini-disk DASD.

QUERY VIRTUAL PAV command

Use the **QUERY VIRTUAL PAV** command to show the status of all PAV and Hyper PAV devices that z/VM ® can access.

Run this command using the following syntax:

```
Query Virtual PAV {vdev | vdev1 - vdev2 | ALL}
```

The following figure shows a sample output of this command.

```
<BASE>
q v pav 1000
HYPERPAV BASE 1000 ON A000 CMA000 ASSIGNED A000 POOL 0

<ALIAS>
q v pav 3000
HYPERPAV ALIAS 3000 ASSIGNED A0C0 POOL 0
```

Troubleshooting

This topic provides PAV troubleshooting information.

- ☐ [General troubleshooting](#)
- ☐ [Contacting customer support](#)

General troubleshooting

For more information about troubleshooting using Device Manager - Storage Navigator, see the *System Administrator Guide*.

For a complete list of Device Manager - Storage Navigator error codes, see the *Hitachi Device Manager - Storage Navigator Messages*.

Contacting customer support

If you are unable to resolve an error condition in Device Manager - Storage Navigator, contact Hitachi Data Systems customer support for assistance.

Before you contact customer support, please gather as much information about the problem as possible, including the following:

- The circumstances surrounding the error or failure.
- The exact content of any error messages displayed on the host systems.
- The exact content of any error messages displayed by Device Manager - Storage Navigator.
- The Device Manager - Storage Navigator configuration information. Use the Device Manager - Storage Navigator Dump Tool to download the dump files and configuration information from the SVP.
- The service information messages (SIMs), including reference codes and severity levels, displayed by Device Manager - Storage Navigator.

The Hitachi Data Systems customer support staff is available 24 hours a day, seven days a week. To contact technical support, log on to Hitachi Data Systems Support Connect for contact information: https://support.hds.com/en_us/contact-us.html

Disabling Compatible Hyper PAV

This topic describes the procedures for disabling Hyper PAV on the storage system.

- ☐ [Disabling Compatible Hyper PAV from z/OS ®](#)
- ☐ [Disabling Compatible Hyper PAV from z/OS ® when using multiple storage systems](#)
- ☐ [Disabling Compatible Hyper PAV from z/OS ® on z/VM ®](#)

Disabling Compatible Hyper PAV from z/OS ®

Before you begin

- All alias device assignments in the storage system must be deleted.
For more information about deleting alias devices from base devices, see [Deleting alias volumes from base volumes on page 48](#).
- You must have Storage Administrator (Provisioning) role to perform this task.

Procedure

1. Run the following commands to all base devices in the corresponding CU:

```
V base_device_number1-base_device_number2,OFFLINE
```

```
CF CHP(channel_path1-channel_path2),OFFLINE
```
2. Run the following command from the host system console to disable the **Compatible Hyper PAV** option on the host computer.

```
SETIOS HYPERPAV=NO
```
3. Remove the Hyper PAV license using Device Manager - Storage Navigator.
4. Run the following DEVSERV command from the z/OS ® to an arbitrary device per CU:

```
DS QD,device_ID,VALIDATE
```
5. To verify that the aliases assigned for Hyper PAV are released, from the host, run the following command:

```
DEVSERV QPAV
```

For proper syntax and an example of this command, see [DEVSERV QPAV commands on page 59](#).

Disabling Compatible Hyper PAV from z/OS ® when using multiple storage systems

Use this procedure when Hyper PAV and Cross-OS File Exchange are still used on other storage systems which are accessed from the corresponding host.

Procedure

1. Run the following commands to all base devices in the corresponding CU.

```
V base_device_number1-base_device_number2,OFFLINE
```

```
CF CHP(channel_path1-channel_path2),OFFLINE
```

2. Remove the Hyper PAV license using Device Manager - Storage Navigator.
3. Run the following commands to all base devices in the corresponding CU.

```
CF CHP(channel_path1-channel_path2),ONLINE
```

```
V base_device_number1-base_device_number2,ONLINE
```

4. Run the DEVSERV QPAV command from the host to verify that the aliases assigned for Hyper PAV are released.
See [DEVSERV QPAV commands on page 59](#) for proper syntax and an example of this command.

Disabling Compatible Hyper PAV from z/OS ® on z/VM ®

You can disable Hyper PAV from z/OS ® on z/VM ®.

Before you begin

- All alias device assignments in the storage system must be deleted.
For more information about deleting alias devices from bases devices, see [Deleting alias volumes from base volumes on page 48](#).
- You must have the Storage Administrator (Provisioning) role to perform this task.

Procedure

1. From z/OS ® on z/VM ®, run the following commands to all base devices in the corresponding CU.

```
V base_device_number1-base_device_number2,OFFLINE
```

```
CF CHP(channel_path1-channel_path2),OFFLINE
```

2. Run the following command from the host system console to disable the **Compatible Hyper PAV** option on the host computer.

```
SETIOS HYPERPAV=NO
```

3. Run the following commands from z/VM ® system console to all alias devices that are used for Hyper PAV in the corresponding CU:

```
DET alias_device_number1-alias_device_number2
```

```
VARY OFFLINE alias_device_number1-alias_device_number2
```

```
SET CU PAV ssid1-ssid2
```

```
VARY ONLINE alias_device_number1-alias_device_number2
```

```
ATT alias_device_number1-alias_device_number2*
```

An asterisk (*) is required at the end of the ATT command.

4. Remove the Hyper PAV license using Device Manager - Storage Navigator.

5. Run the following DEVSERV command from the z/OS ® to an arbitrary device per CU:

`DS QD,device_ID,VALIDATE`

6. Run the QUERY PAV command from z/VM ® to verify that the aliases assigned for Hyper PAV are released.

For proper syntax and an example of this command, see [QUERY PAV command on page 64](#).

7. Run the DEVSERV QPAV command from the z/OS ® to verify that the aliases assigned for Hyper PAV are released.

See [DEVSERV QPAV commands on page 59](#) for proper syntax and an example of this command.

Compatible PAV GUI reference

This topic describes the items and options available in the **Assign Alias Volumes** window.

- [Hitachi Compatible PAV window](#)

Hitachi Compatible PAV window

Use the Compatible PAV window to assign alias devices to base devices.

Selected 1/32 Selected 0/0 Selected 1/208

Select All Select All Select All

Delete Add

Apply Cancel

Item	Description
LDKC	Selects the LDKC that contains the desired CUs and LDEVs.
CU	Selects the logical CU image that contains the desired LDEVs. The volume lists on the Compatible PAV window display only the LDEVs for the selected CU image. CU numbers are included in the currently selected LDKC. To indicate the CU numbers included in another LDKC, select the LDKC that includes the chosen CU number in the LDKC list.
Compatible PAV Used Capacity	<p>Indicates the capacity currently being used by base volumes. The value in the parentheses indicates the total available capacity (in terabytes) in the storage system for Compatible PAV.</p> <p>Values:</p> <p>Unlimited: Indicates that the licensed capacity is unlimited.</p> <p>--- : Indicates you are using a temporary key or the emergency key.</p> <p>The used capacity is enclosed in angle brackets (< >): Indicates the calculation has not been completed.</p>
Base Volume List	Displays the LDEVs that are currently in use in the selected CU image.

Item	Description
	For a description of the items, see Base Volume List on page 75 .
Alias Volume List	Displays the alias devices assigned to the selected base devices. For a description of the items, see Alias Volume List on page 75 .
Free Volume List	Displays the LDEV addresses of unused volumes in the selected CU. For a description of the items, see Free Volume List on page 76 .
Add	Assigns aliases to selected base devices. When you click Add, the selected free LDEVs are assigned to the selected base devices. The new alias devices are displayed in the Alias Volume List, and the LDEV addresses are no longer displayed in the Free Volume List. To complete your request to assign the new aliases as specified, you must click Apply.
Delete button	Removes aliases assigned to a selected base device. When you click Delete, the selected alias devices are removed from the Alias Volume List, and their LDEVs are displayed in the Free Volume List. To complete removing the aliases as specified, you must click Apply.
Apply button	Applies the settings to the storage system.
Cancel button	Discards any changes and restores the initial settings.

Base Volume List

The Base Volume List displays the LDEVs that are currently defined in the selected CU image. Each of these LDEVs can be a Compatible PAV base device. When you assign and remove aliases for base devices, you select the base devices from this list. The following table describes the items in the Base Volume List.

Item	Description
Base Volume	Displays the LDKC number, CU number, and LDEV number of the base volume. For the volume used for Compatible PAV, an asterisk (*) is attached next to the LDEV number (for example, 00:00:00 *). The capacity of the volumes attached asterisks (*) is an object for calculation of used capacity.
Alias Count (Initial)	Displays the number of aliases currently assigned to the base volume in the disk storage system. The number of aliases set in the base volume by the user is also displayed in the parentheses.
Selected	Displays the number of selected base volumes and the total number of base volumes in the selected CU image. For example, 2/73 indicates that two base volumes are selected out of a total of 73 base volumes in the selected CU image.
Select All	Selects all volumes in the Base Volume List.

Alias Volume List

The Alias Volume List displays the alias devices assigned to the selected base devices. To view all alias devices for the selected CU image, you must select all of the base devices. When you cancel aliases for base devices, you select the alias devices from this list. The following table describes the items in the Alias Volume List.

Item	Description
Alias Volume	Displays the LDKC, CU, and LDEV numbers of the alias volume.
Current Base	Displays the LDKC, CU, and LDEV numbers of the base volume currently assigned to the alias volume in the disk storage system.
Initial Base	Displays the LDKC, CU, and LDEV numbers of the base volume set by the user for the alias volume.
Selected	Displays the number of selected alias devices and the total number of alias devices in the selected CU image. For example, 2/4 indicates that two aliases are selected out of a total of four alias devices in the selected CU image.
Select All button	Selects all volumes in the Alias Volume List.

Free Volume List

The Free Volume List displays the LDEV IDs of unused volumes in the selected CU. Any free volume can be used as a Compatible PAV alias device. Use this list to select aliases to assign to base volumes. The following table describes the items in the Free Volume List.

Item	Description
Free Volume	Displays the complete list of volumes available for assignment.
Selected	Displays the number of selected free devices and the total number of free devices in the selected CU image. For example, 8/47 indicates that eight free devices are selected out of a total of 47 free devices in the selected CU image.
Select All	Selects all volumes in the Free Volume List.

Glossary

A

alias device

A formatted but unused mainframe logical device (LDEV) whose address can be used as an alias for a Hitachi Compatible PAV (PAV) base device. See also base device

APAR

Authorized Problem Analysis Report

B

base device

A formatted mainframe logical device (LDEV) that contains user data and can be accessed through alias devices using Hitachi Compatible PAV (PAV) host software. A base device must be defined to the host as a “B” device type (e.g., 3390B-9). See also alias device

C

cache

A set of RAM (Random Access Memory) modules used to store data temporarily.

capacity

The amount of data storage space available on a physical storage device, generally measured in bytes (MB, GB, TB, and so on).

CH

Channel

CHA

channel adapter

channel path

The communication path between a channel and a control unit. A channel path consists of the physical channel path and the logical path.

control unit (CU)

Created in an enterprise-class storage system. Also called a CU image. The LDEVs created in a storage system are connected to a single CU, and a number is assigned to each CU for identifying its LDEVs. Therefore, volumes (LDEVs) in a storage system are specified by the CU number (CU#) and LDEV number.

D

DASD

direct-access storage device

device (dev or DEV)

A physical or logical unit with a specific function.

device emulation

Indicates the type of logical volume. Mainframe device emulation types provide logical volumes of fixed size, called logical volume images (LVIs), which contain EBCDIC data in CKD format. Typical mainframe device emulation types include 3390-9 and 3390-M. Open-systems device emulation types provide logical volumes of variable size, called logical units (LUs), that contain ASCII data in FBA format. The typical open-systems device emulation type is OPEN-V.

I

IPL

initial program load

ISPF/PDF

Interactive System Productivity Facility/package definition file

J

JCL

job control language

L

LCU

logical control unit

logical device (LDEV)

A volume created in a storage system. See also LU.

logical volume

An area on a disk consisting of device files that are logically integrated using a volume manager. Also referred to as an LDEV.

logical volume image (LVI)

An LDEV that is configured for use by mainframe hosts (for example, 3390-3).

M

MIH

missing interrupt handler

MVS

Multiple Virtual Storage

N

NUM

number

P

PAV

Hitachi Compatible PAV

PPRC

Peer-to-Peer Remote Copy

R

R-SIM

remote service information message

RAID

redundant array of independent disks

A collection of two or more disk drives that presents the image of a single logical disk drive to the system. Part of the physical storage capacity is used to store redundant information about user data stored on the remainder of the storage capacity. In the event of a single device failure, the data can be read or regenerated from the other disk drives.

RAID employs the technique of disk striping, which involves partitioning each drive's storage space into units ranging from a sector (512 bytes) up to several megabytes. The stripes of all the disks are interleaved and addressed in order.

S

SIM

service information message

SIz

ShadowImage for Mainframe

SMS

Storage Management Subsystem

SSCH

start subchannel

storage subsystem identifier (SSID)

In a mainframe environment, SSIDs are used for reporting information from the control unit (CU) image to the mainframe operating system. An SSID is assigned to each group of 64 or 256 volumes to define one or four SSIDs per CU image. The user-specified SSIDs are assigned during storage system installation and must be unique to all connected host operating environments.

V

virtual machine

One instance of an operating system along with one or more applications running in an isolated partition within the computer. A VM enables different operating systems to run in the same computer at the same time as well as prevents applications from interfering with each other. All virtual machines run simultaneously.

volume (vol or VOL)

A name for the logical device (LDEV), or logical unit (LU), or concatenated LDEVs, that are created in a storage system that have been defined to one or more hosts as a single data storage unit.
