

# Hitachi Virtual Storage Platform Fx00 and Gx00

## Service Processor Technical Reference

This guide is intended for system administrators, Hitachi Vantara representatives, and authorized service providers who install, configure, or operate VSP Gx00 models and VSP Fx00 models. In addition, this guide provides information about setup, configuring, and maintaining both physical and virtual service processor.

#### Disposal

This symbol on the product or on its packaging means that your electrical and electronic equipment should be disposed at the end of life separately from your household wastes.

There are separate collection systems for recycling in the European Union. For more information, contact the local authority or the dealer where you purchased the product.

#### Recycling

A nickel-metal hydride battery is used in the Cache Backup Battery.

A nickel-metal hydride battery is a resource that can be recycled. When you want to replace the Cache Backup Battery, call the service personnel. They will dispose of it for you. This nickel-metal hydride battery, which is designated as recycling product by a recycling promotion low, must be recycled.

The mark posted on the Cache Backup Battery is a three-arrow mark that indicates a recyclable part.

## Preface

## **Intended audience**

This document is intended for Hitachi Vantara representatives and authorized service providers who install, configure, or operate storage systems.

This document is intended for customers inquiring about the features and specifications of the storage system.

Readers of this document should be familiar with the following:

- Data processing and RAID storage systems and their basic functions.
- The operating system and web browser software on the system hosting the storage management software.

### **Document conventions**

This document uses the following typographic conventions:

Convention		Description
Bold	•	Indicates text in a window, including window titles, menus, menu options, buttons, fields, and labels. Example:
		Click <b>OK</b> .
	•	Indicates emphasized words in list items.
Italic	•	Indicates a document title or emphasized words in text.
	•	Indicates a variable, which is a placeholder for actual text provided by the user or for output by the system. Example:
		pairdisplay -g <i>group</i>
		(For exceptions to this convention for variables, see the entry for angle brackets.)
Monospace	Indicates text that is displayed on screen or entered by the user. Example: pairdisplay -g oradb	

Convention	Description	
< > angle	Indicates variables in the following scenarios:	
brackets	<ul> <li>Variables are not clearly separated from the surrounding text or from other variables. Example:</li> </ul>	
	Status- <report-name><file-version>.csv</file-version></report-name>	
	<ul> <li>Variables in headings.</li> </ul>	
[] square brackets	Indicates optional values. Example: [ a   b ] indicates that you can choose a, b, or nothing.	
{ } braces	Indicates required or expected values. Example: { a   b } indicates that you must choose either a or b.	
vertical bar	Indicates that you have a choice between two or more options or arguments. Examples:	
	[ a   b ] indicates that you can choose a, b, or nothing.	
	{ a   b } indicates that you must choose either a or b.	

This document uses the following icons to draw attention to information:

lcon	Label	Description
	Note	Calls attention to important or additional information.
0	Тір	Provides helpful information, guidelines, or suggestions for performing tasks more effectively.
	Caution	Warns the user of adverse conditions and/or consequences (for example, disruptive operations, data loss, or a system crash).
	WARNING	Warns the user of a hazardous situation which, if not avoided, could result in death or serious injury.

## Changes in this revision

- Added physical, electrical, and environmental specifications for new service processor hardware with Microsoft Windows 10 Enterprise.
- Updated diagrams in Operating the physical SVP in a non-bridged network configuration.

## **Conventions for storage capacity values**

Physical storage capacity values (for example, disk drive capacity) are calculated based on the following values:

Physical capacity unit	Value
1 kilobyte (KB)	1,000 (10 <sup>3</sup> ) bytes
1 megabyte (MB)	1,000 KB or 1,000 <sup>2</sup> bytes
1 gigabyte (GB)	1,000 MB or 1,000 <sup>3</sup> bytes
1 terabyte (TB)	1,000 GB or 1,000 <sup>4</sup> bytes
1 petabyte (PB)	1,000 TB or 1,000 <sup>5</sup> bytes
1 exabyte (EB)	1,000 PB or 1,000 <sup>6</sup> bytes

Logical capacity values (for example, logical device capacity, cache memory capacity) are calculated based on the following values:

Logical capacity unit	Value
1 block	512 bytes
1 cylinder	Mainframe: 870 KB
	Open-systems:
	• OPEN-V: 960 KB
	<ul> <li>Others: 720 KB</li> </ul>
1 KB	1,024 (2 <sup>10</sup> ) bytes
1 MB	1,024 KB or 1,024 <sup>2</sup> bytes
1 GB	1,024 MB or 1,024 <sup>3</sup> bytes
1 TB	1,024 GB or 1,024 <sup>4</sup> bytes
1 PB	1,024 TB or 1,024 <sup>5</sup> bytes
1 EB	1,024 PB or 1,024 <sup>6</sup> bytes

## Accessing product documentation

Product user documentation is available on Hitachi Vantara Support Connect: <u>https://knowledge.hitachivantara.com/Documents</u>. Check this site for the most current documentation, including important updates that may have been made after the release of the product.

## **Getting help**

<u>Hitachi Vantara Support Connect</u> is the destination for technical support of products and solutions sold by Hitachi Vantara. To contact technical support, log on to Hitachi Vantara Support Connect for contact information: <u>https://support.hitachivantara.com/en\_us/contact-us.html</u>.

<u>Hitachi Vantara Community</u> is a global online community for Hitachi Vantara customers, partners, independent software vendors, employees, and prospects. It is the destination to get answers, discover insights, and make connections. **Join the conversation today!** Go to <u>community.hitachivantara.com</u>, register, and complete your profile.

## Comments

Please send us your comments on this document to <u>doc.comments@hitachivantara.com</u>. Include the document title and number, including the revision level (for example, -07), and refer to specific sections and paragraphs whenever possible. All comments become the property of Hitachi Vantara Corporation.

#### Thank you!

## **Chapter 1: SVP overview**

The Service Processor (SVP) provides out-of-band configuration and management of the storage system, and collects performance data for key components to enable diagnostic testing and analysis.

The SVP is available as a physical (bare-metal) 1U management server or as a 64-bit software application provided by Hitachi Vantara. The physical SVP server and the SVP software applications are supported in the environments shown in the following table.

For the latest interoperability updates and details, see the *SVP* (*Service Processor*) *OS* and *Hypervisor support for Gx00, Fx00* report at <u>https://support.hitachivantara.com/en\_us/</u><u>interoperability.html</u>.

Operating system	Server/virtual machine	Minimum SVP version	Notes and additional requirements
Windows 7	VMware ESXi 6.0.0	88-01-02-x0/00	-
Professional	KVM on Oracle Linux 7.2	88-01-02-x0/00 <sup>1</sup>	
	(3.8.13-98.7.1.el7ue k.x86_64, qemu- kvm-1.5.3-105.el7.x 86_64)

2016	installation (see requirements)	83-04-47-x0/00	-

#### Table 2 Service processor (with Windows 7)

Chapter 1: SVP overview

The bare metal servers must meet the following requirements.

Item	Specification
Processor:	One core with hyper-threading, two cores without hyper-threading
	Processor performance comparable to Celeron 1.6 GHz
Random-access memory:	3.5 GB per storage system
Hard drive capacity:	120 GB per storage system
LAN connection:	One 1000Base-T

The following table lists SVP VM requirements.

VM platform	Requirements	Corresponding SVP guest OS
ESX Server	VMware ESXi server 6.0	SVP Guest OS (maximum one DKC per SVP guest OS)
	Two quad core processors, Intel Xeon 2.29 GHz	Two virtual CPUs
	One port network interface card (NIC)	One virtual network adapter
	32 GB RAM	4 GB RAM
		120 GB disk space
Linux KVM Server	Oracle Linux 7.2	Same as ESX Server
	Two quad core processors, Intel Xeon 2.29 GHz	
	One-port NIC	
	128 GB RAM	
Hyper-V Server	Hyper-V server 2012 R2	Same as ESX Server
	Two quad core processors, Intel Xeon 2.29 GHz	
	One port NIC	
	32 GB RAM	

Chapter 1: SVP overview

**Note:** Only one storage array (DKC) can be managed per SVP software instance. Only one SVP software instance can be installed per OS instance. However, multiple virtual machines that each run their own OS/SVP software instance can be installed on a physical server. Other software is not supported when run in the same OS instance with the SVP software.

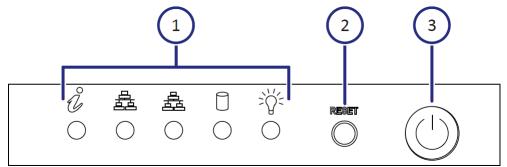

Chapter 1: SVP overview

# Chapter 2: Physical SVP (Windows 7) hardware description

The physical SVP with Windows 7 operating system is provided by Hitachi Vantara. The physical SVP is a 1U management server that attaches to each VSP disk controller (DKC). The following sections describe the front and rear panels of the Hitachi Vantara-supplied physical SVP, along with the physical, electrical, and environmental specifications.

## **SVP** front panel

The front panel of the physical SVP is equipped with LEDs, a reset button, and a power button.

#### Table 3 SVP (Windows 7) front panel

Item	Description	
1	LEDs. From left to right, the LEDs are:	
	BMC Heartbeat	
	LAN card 2	
	LAN card 1	
	Hard drive	
	<ul> <li>System standby power</li> </ul>	
2	Reset button.	
3	Power button. Applies power to or removes power from the SVP.	

## **SVP** rear panel

The only ports used at the rear panel of the physical SVP are the power socket and the four LAN ports. The following ports connect to your IP network, the management console PC, and the user LAN port on each storage system controller.

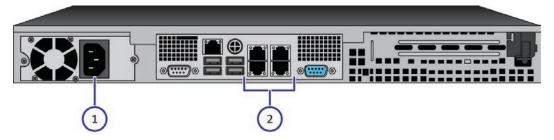

Table 4 SVP (Windows 7) rear panel

Item	Description
1	Power socket. Attach the power cable supplied with the SVP.
2	Four LAN ports arranged as follows:
	LAN3 LAN4
	LAN1 LAN2
	These ports connect to your IP network, the management console PC, and the user LAN port on each storage system controller.

**Note:** After the Initial Startup Wizard is run, the SVP can be used in nonbridge mode. In this mode, the cables can be removed from SVP ports LAN3 and LAN4 and attached to switches. For more information, contact customer support.

## Service processor (Windows 7) hardware specifications

The following table lists the hardware specifications for the service processor (SVP) provided by Hitachi Vantara.

**Caution:** The SVP is not supported in high-temperature environments. Do not operate it in locations with temperatures above 40°C.

Item	Specification	
Dimensions	Height: 1.7 inches (43 mm)	
	Width: 17.2 inches (437 mm)	
	Depth: 14.5 inches (369 mm)	
	Weight: 14 lbs (6.4 kg)	
Processor	Celeron G1820 2.7-GHz 2M, 2C, 2T	
	Cores: 2	
	<ul> <li>Instruction set: 64-bit</li> </ul>	
	<ul> <li>SmartCache: 2 MB</li> </ul>	
	<ul> <li>Maximum memory size: 32 GB</li> </ul>	
	<ul> <li>Memory types: DDR3-1333, DDR3L-1333 @ 1.5V</li> </ul>	
Memory	8-GB RAM DDR3	
Hard drive	2 TB	
Network interface card	x4 ports (on-board NIC) +	
	x1 IPMI (BMC) port	
Fans	2 x 4-cm 4-pin PWM fans	
Operating system	Windows Embedded Standard 7	

## Physical SVP (Windows 7) electrical specifications

The following table lists the electrical specifications for the physical SVP supplied by Hitachi Vantara.

Item	Specification	
Rated AC voltage	100-240 V, 50-60 Hz, 4.2 - 1.8A	
Power supply	350 W AC power supply with PFC	
AC voltage	100-240 V, 50-60 Hz, 4.2 - 1.8 Amp	
Power supply safety / EMC	USA - UL listed, FCC	
	<ul> <li>Canada - CUL listed</li> </ul>	
	<ul> <li>Germany - TUV Certified</li> </ul>	

Item	Specification	
	<ul> <li>Europe/CE Mark</li> </ul>	
	• EN 60950/IEC 60950-Compliant	

MFT p-code	Description	watts
MBD-X10SLM+-LN4F-O	Single-socket H3 (LGA 1150) / 32-GB DDR3 ECC 1600 MHz / 6x SATA / 4x GbE	20 W
CSE-512F-350B	Two 350 W 3.5-inch internal drive bays	26.4 W
CM8064601483405	Intel Celeron G1820 2.7 Ghz 2M tray	53 W
0F11000	3.5-inch 25.4 mm 2 TB 32 MB 7200 RPM	9.1 W
KVR16E11S8	4 GB 1600 Mhz DIMM SR x8 with TS Kingston F	4.05 W
	Total	112.55 W

VA is 140.69, with a 0.8 power factor.

**Note:** The measurements are not kilo values.

## Physical SVP (Windows 7) environmental specifications

The following table lists the environmental specifications for the physical SVP supplied by Hitachi Vantara.

ltem	Specification	
Operating temperature	41°F ~ 95°F	
	(5°C ~ 35°C)	
Non-operating temperature range	-40°F ~ 140°F	

(-40°C ~ 60°C)		
Operating relative humidity range	8% ~ 90% (non-condensing)	
Non-operating relative humidity range	5% - 95% (non-condensing)	

# Chapter 3: Physical SVP (Windows 10 Enterprise) hardware description

The physical SVP with Windows 10 Enterprise operating system is provided by Hitachi Vantara. The physical SVP is a 1U management server that attaches to each VSP disk controller (DKC). The following sections describe the front and rear panels of the Hitachi Vantara-supplied physical SVP, along with the physical, electrical, and environmental specifications.

## **SVP** front panel

The front panel of the physical SVP with Windows 10 Enterprise operating system is equipped with LEDs, a reset button, and a power button.

Item	Description		
1	LED (Left to Right):		
	• N/A		
	LAN card 2		
	LAN card 1		
	Hard drive		
	<ul> <li>System standby power</li> </ul>		
2	Reset button		
3	Power button		

Table 5 SVP (Windows 10 Enterprise) front panel

## **SVP** rear panel

The only ports used at the rear panel of the physical SVP are the power socket and the four LAN ports. The following ports connect to your IP network, the management console PC, and the user LAN port on each storage system controller.

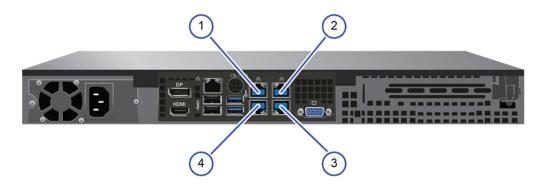

Table 6 SVP (Windows 10 Enterprise) rear panel

Item Description			
1	Management (DKC CTL1) - LAN3 port		
2	Management (DKC CTL2) - LAN4 port		
3	Maintenance - LAN2 port		
4	Management (User) - LAN1 port		

**Note:** The SVP running Windows 10 operating system does not provide an option to disable Spanning Tree Protocol (STP). If your network has BPDU enabled to prevent loops, connect the user LAN port on controllers 1 and 2 to an Ethernet switch that is also connected to the LAN1 port on the SVP.

**Note:** After the Initial Startup Wizard is complete, the SVP can be used in nonbridge mode. In this mode, the cables can be removed from SVP ports LAN3 and LAN4 and attached to switches. For more information, contact customer support.

## Service Processor (Windows 10 Enterprise) hardware specifications

The following table lists the hardware specifications for the service processor (Windows 10 Enterprise) provided by Hitachi Vantara.

Item	Specification		
Dimensions	Height: 1.7 inches (43 mm)		
	Width: 17.2 inches (437 mm)		
	Depth: 9.8 inches (249 mm)		
	Weight: 10 lbs (4.5 kg)		
Processor	Intel N3710 Pentium processor 4C/4 threads 1.6 GHz 2M cache, 6W		
Memory	2 x 4 GB DDR3 1600MHz		
Storage media	1 TB 5400 RPM SATA HDD		
LAN/Network interface card	1-GbE x 4 ports (on-board NIC)		
	x1 IPMI (BMC) port		
Fans	2 x 4028 mm 13KPRM 4-pin PWM fans		
Operating system	Windows 10 Enterprise		
Maximum temperature	Up to 40° C (104° Fahrenheit)		
	The SVP is supported in high-temperature environments. Do not operate in any location with temperatures above 40°C (104° Fahrenheit).		

## Physical SVP (Windows 10 Enterprise) electrical specifications

The following table lists the electrical specifications for the physical SVP supplied by Hitachi Vantara.

Item	Specification		
Rated AC voltage	100-240 V, 50-60 Hz, 4 - 2A		
Power supply	200 W AC power supply		
AC voltage	100-240 V, 50-60 Hz, 4 - 2 Amp		
Power supply safety / EMC	USA - UL listed, FCC		
	<ul> <li>Canada - CUL listed</li> </ul>		
	<ul> <li>Germany - TUV Certified</li> </ul>		

Item	Specification		
	<ul> <li>Europe/CE Mark</li> </ul>		
	<ul> <li>EN 60950/IEC 60950-Compliant</li> </ul>		

## Physical SVP (Windows 10 Enterprise) environmental specifications

The following table lists the environmental specifications for the physical SVP supplied by Hitachi Vantara.

Item	Specification	
Operating temperature	41°F ~ 104°F	
	(5°C ~ 40°C)	
Non-operating temperature range	-40°F ~ 158°F	
	(-40°C ~ 70°C)	
Operating relative humidity range	e humidity range 8% ~ 90% (non-condensing)	
Non-operating relative humidity range	midity range 5% - 95% (non-condensing)	

## Chapter 4: Installing the Hitachi Vantarasupplied SVP

Hitachi Vantara provides a 1U SVP for use with the VSP Gx00 models and VSP Fx00 models. The SVP operates independently from the storage system's CPU and operating system.

The SVP provides out-of-band configuration and management of the storage system, and collects performance data for key components to enable diagnostic testing and analysis. The SVP runs the Windows Embedded Standard 7 or 10 Enterprise operating system, and is installed above the controller and drive trays in the rack.

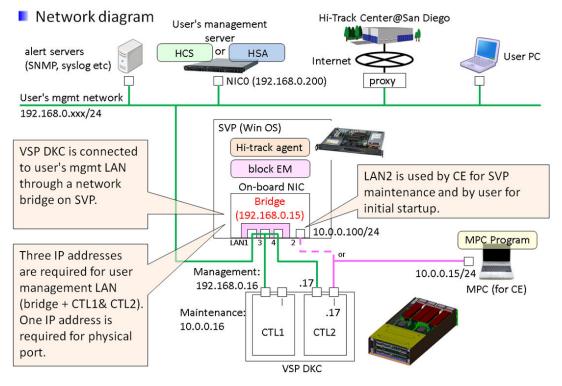

**Important:** The Hitachi Vantara-supplied SVP can only be installed, upgraded, or replaced by a Hitachi Vantara representative or an authorized service provider. Contact a Hitachi Vantara representative for more information about installing, upgrading, or replacing a Hitachi Vantara-supplied SVP.

## **Physical SVP network configuration**

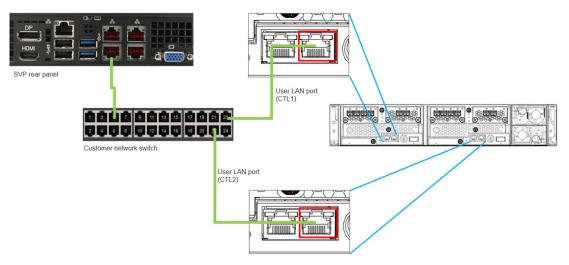

In networking terms, a *network bridge* is software or hardware that connects two or more networks so that they can communicate. For the physical SVP, a network bridge configures the three local-area network (LAN) ports on the SVP using the Bridge Connections setting in the Windows operating system. This configuration requires an external switching hub.

The following figure shows the physical SVP in a bridged network configuration.

**Note:** The Hitachi Vantara-supplied server running the Windows operating system cannot be used with the storage system if it belongs to different subnets, and if a router or a firewall is filtering packets according to a defined condition. There is not a limit for distance between the server running the SVP application and the storage array being managed if they belong to the same subnet.

The following figure shows a physical SVP in non-bridged environment.

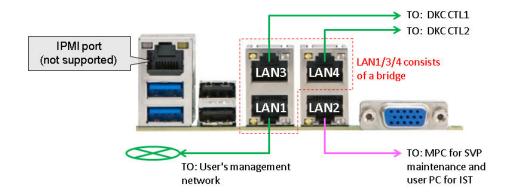

For information about configuring an SVP for a non-bridged network environment, see <u>Operating the physical SVP in a non-bridged network configuration (on page 35)</u>.

#### **Physical SVP LAN port assignment**

The LAN port assignments on the physical SVP should match the ones in the following figure.

The IPMI port is an IPMI-dedicated port connected to the BMC in the SVP and is invisible from the Windows operating system. For security reasons, the IPMI port cannot be enabled in BIOS setting and is not supported for the SVP.

## **Default IP address settings**

The physical SVP is pre-configured with a default IP addresses and bridge the LAN 1/3/4.

The user connects to the SVP using the IP address 192.168.0.15 for LAN1/3/4 ports (management) or 10.0.0.100 for LAN2 port (maintenance), respectively.

Port	Name of NIC (user can change a NIC name)	Connected to	Default IP address	IP address after bridge is configured	Notes
LAN 1	Management (User)	Management LAN	N/A (DHCP)	192.168.0.15 /24	Part of bridge. IST uses LAN1/3/4 or 2 ports for Remote Desktop Protocol (RDP).
LAN 2	Maintenance	MPC or User PC	10.0.0.100/2 4	<	Not a part of bridge. IST uses LAN1/3/4 or 2 ports for RDP.
LAN 3	Management (CTL1)	DKC CTL1	N/A (DHCP)	192.168.0.15 /24	Part of the bridge.
LAN 4	Management (CTL2)	DKC CTL2	N/A (DHCP)	192.168.0.15 /24	Part of the bridge.
IPMI	N/A	User PC	N/A (disabled)	<	Not supported (user's discretion)

## Installing a physical SVP

The following describes how to install the physical SVP into a rack and configure it for your network environment.

**Caution:** The physical SVP (Windows 7) is not supported in high-temperature environments. Do not operate the SVP at temperatures above 95°F (35°C).

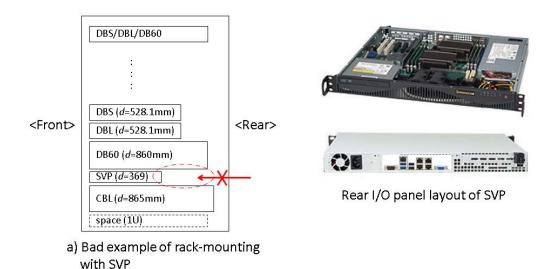

**Caution:** The SVP (Windows 10) is supported in high-temperature environments. Do not operate the SVP at temperatures above 104°F (40°C).

## Mounting the physical SVP

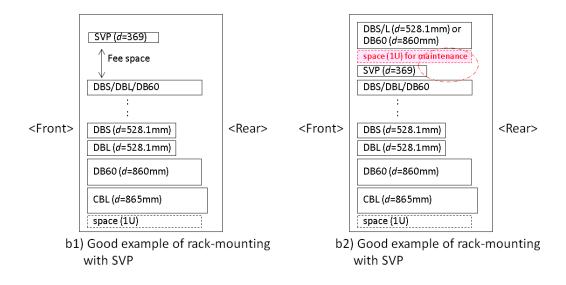

The physical SVP has a depth of 14.5 inches (369 mm). The 4U CBL controller and dense intermix drive tray (DB60) have a depth of 34.1 inches (865 mm) and 33.9 inches (860 mm), respectively.

If the SVP is rack-mounted between a CBL and dense intermix drive tray, as shown in the following figure, there is not enough space to access the rear I/O panel of the SVP.

To verify that the SVP can be accessed for maintenance:

- Locate the SVP at the top of the rack or above the system.
- If a small form factor drive tray (DBS) or dense intermix drive tray (DB60) is added at the top of the rack, prepare a 1U space between the system and the small form factor, large form factor, and dense intermix drive trays.

### **Choosing a mounting location**

Mounting the physical SVP appropriately in the rack is critical to ensure optimum performance.

#### Procedure

- **1.** Install the physical SVP in the top bay of the rack or as close to the top bay as possible.
- **2.** Leave approximately 25 inches in front of the rack to enable you to open the front bezel.
- **3.** Leave approximately 30 inches of clearance in the back of the rack to allow for sufficient airflow and ease in servicing.

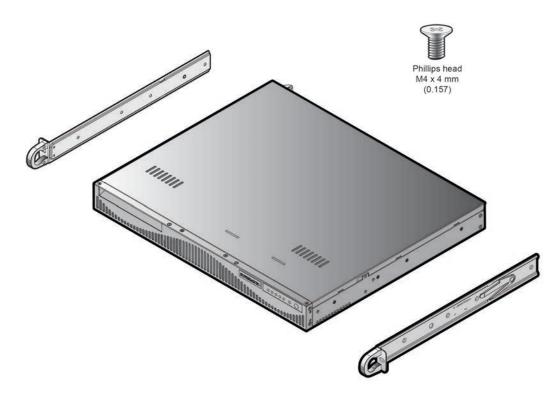

### Installing the inner rail extension

The physical SVP contains two rack rail assemblies. Each assembly consists of an inner fixed chassis rail that secures directly to the SVP chassis, and an outer fixed rack rail that secures directly to the rack itself.

The physical SVP includes chassis ears that you must remove before installing the rails.

#### Procedure

- **1.** Remove the chassis ears.
  - a. Locate and remove the three screws holding the chassis ear in place.
  - b. Repeat with the other chassis ear.

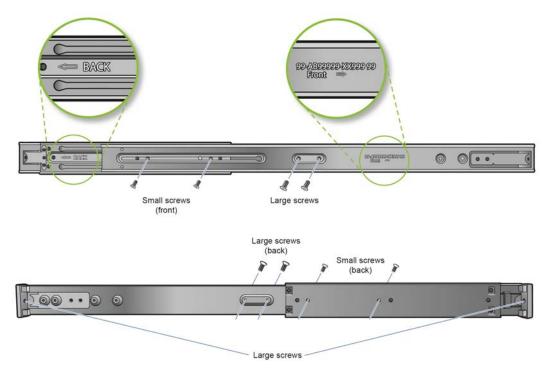

- **2.** Find the **Front** marking on the rails, and then orient the rails appropriately for attaching to the SVP chassis.
- **3.** Screw the internal racks onto the SVP chassis using the four large screws and the two small screws.
- **4.** Repeat steps 2 and 3 for the inner rail extension on the other side of the SVP chassis.

### Installing the outer rails to the rack

The outer rails that secure the physical SVP directly to the rack.

#### Procedure

- Attach the short bracket to the outside of the long bracket. You must align the pin with the slide.
- 2. Using the directions on the rails, orient the rails so that the front of the rail faces the front of the rack. Adjust both the short rail and long rail to the proper distance, so that they fit snugly into the rack. Then insert two small screws and two large M5 screws into the threaded holes in the slide area on the rails, as shown in the following figure, to prevent the rails from moving.
- **3.** Secure the long outer rail to the vertical rail at the front of the rack using a washer and an M5 screw on one side of the rail and a safety nut on the other side. Then connect the short outer rail to the vertical rail at the rear of the rack using another washer and M5 screw.

4. Repeat steps 1 through 3 for the other outer rail.

### Installing the physical SVP into the rack

After the inner and outer rails are attached to the physical SVP, the SVP can be installed in a rack.

#### Before you begin

Confirm the following:

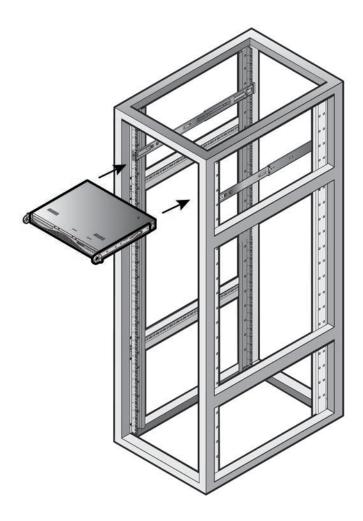

- The inner rails are attached to the SVP enclosure.
- The outer rails are attached to the rack.

#### Procedure

- **1.** Align the SVP enclosure inner rails with the front of the horizontal outer rails on the rack.
- **2.** Slide the SVP enclosure inner rails into the outer rails on the rack, keeping the pressure even on both sides.

If necessary, press the locking tabs when inserting.

When the SVP enclosure is pushed completely into the rack, the locking tabs snap into the locked position.

## Connecting to the physical SVP

All port connections to the physical SVP are located at the rear of the SVP.

The management console must be able to access the SVP. Use Category 5 or higher Ethernet cables to connect to SVP.

**Note:** The SVP running Windows 10 operating system does not provide an option to disable Spanning Tree Protocol (STP). If your network has BPDU enabled to prevent loops, connect the user LAN port on controllers 1 and 2 to an Ethernet switch that is also connected to the LAN1 port on the SVP.

#### Procedure

1. Connect the LAN1 port to a switch on your IP network.

**Note:** If your network uses IP addresses 192.168.0.15-17, do not connect the **LAN1** port to your switch until after you complete the Initial Startup.

- **2.** Connect the **LAN2** port to a management console PC. Typically, this is a notebook PC.
- 3. Connect the LAN3 port to the user LAN port on storage system controller 1.

- SVP LAN3 Connected to user LAN port on Controller 1 Network Switch LAN2 Management Console PC
- 4. Connect the LAN4 port to the user LAN port on storage system controller 2.

After you connect the physical SVP, you can set up an encrypted Secure Sockets Layer (SSL) connection between the storage system and the SVP.

Note: The creation of private and public keys requires a dedicated program, OpenSSL. OpenSSL is installed along with Storage Navigator but not allowed to be used for different purposes. To use OpenSSL for SSL communication settings, download one from the OpenSSL website (http://www.openssl.org/).

For more information, see the Service Processor Technical Reference.

### Turning on power to the physical SVP

When turning on the power to the physical SVP, use only the power cable supplied with the SVP. Do not use a power cable designed for another device.

#### Procedure

**1.** Attach the supplied power cable to the power socket on the rear panel of the physical SVP.

**2.** Plug the other end of the power cable into an AC power source.

After you turn on the power, you can change the physical SVP configuration from a bridged network connection to a non-bridged network connection if BDPU guard is enabled in your networking environment.

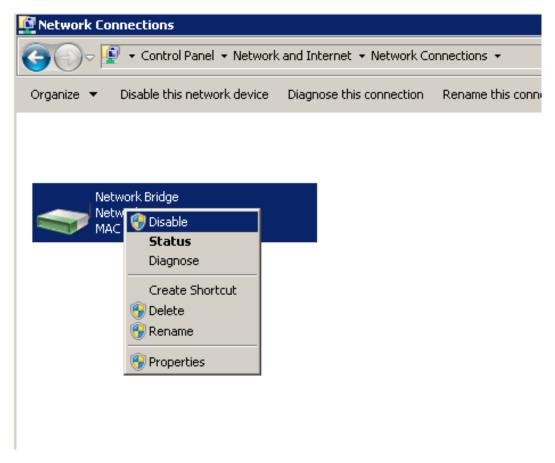

#### Operating the physical SVP in a non-bridged network configuration

If BPDU is enabled in your network environment, use the following non-bridged configuration. This configuration disables the SVP's internal bridge, and allows you to connect the Ethernet cables from the User LAN port on CTL1 and CTL2 to the Ethernet switch.

#### Procedure

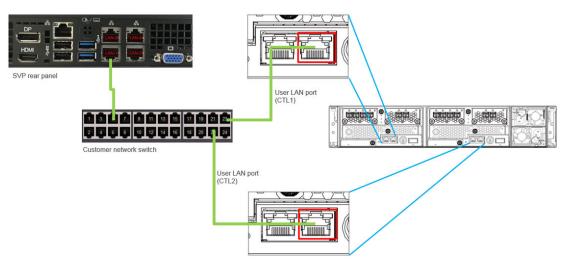

- **1.** Connect a PC to the LAN2 port on the SVP.
- **2.** Log on to the SVP using the Remote Desktop Connection:
  - a. Configure the PC to use an IP address of 10.0.0.xxx, where xxx = 1-99 or 101-254, and a subnet mask of 255.255.255.0.
  - b. Click **Start > All Programs**, and then select **Accessories > Remote Desktop Connection**.
  - c. In the **Computer** field, type 10.0.0.100 and click **Connect**.
  - d. In the **Windows Security** screen, type SVP-PC\SVP in the top field and raidlogin in the bottom field.
  - e. Click **OK**.
  - f. If prompted that the identity of the remote computer cannot be verified, click **Yes** to continue.
- 3. In the Remote Desktop Connection window, select Control Panel > Network and Sharing Center.
- 4. Click Change adapter settings.
- **5.** Right-click the network bridge icon, and then click **Disable**.

The SVP internal bridge is now disabled.

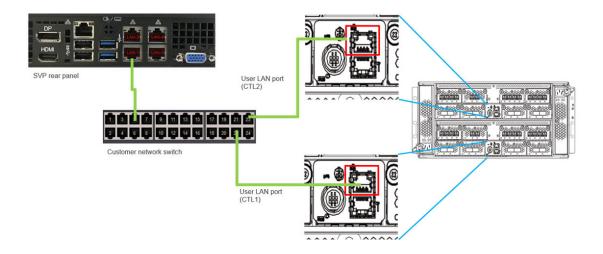

**6.** Remove the Ethernet cables from SVP ports LAN3 and LAN4, and attach them to the Ethernet switches.

The following figure shows a CBSS and CBSL storage system in a non-bridged environment.

The following figure shows a CBLM and CBLH storage system in a non-bridged environment.

## Setting the SVP date, time, and time zone settings

Use the management console PC to set the SVP date, time, and time zone according to the local time of the location of the installed SVP. You specify these settings using the Windows 7 operating system running on the SVP, and then specify the same settings in the maintenance utility.

#### Before you begin

- Verify the management PC is connected to the LAN2 port on the SVP.
- Verify the PC establishes a Remote Desktop Connection to the SVP.
- Confirm the Management Utility window opens on the PC.

#### Procedure

- 1. In the desktop, click the **Start** button, and then click **Control Panel**.
- 2. Click Clock, Language, and Region.
- 3. Click Date and Time.

## Disconnecting the management console from the physical SVP

If you need to disconnect the management console from the physical SVP, use the following procedure.

#### Procedure

- **1.** Click the **Start** button on the SVP desktop.
- 2. Click Log off > Disconnect.

#### Result

The SVP disconnects from the PC.

# Chapter 5: Installing the SVP software on a customer-supplied server

The SVP provides out-of-band configuration and management of the storage system, and collects performance data for key components to enable diagnostic testing and analysis. To meet the SVP requirement for VSP Gx00 models and VSP Fx00 models, Hitachi Vantara supports bare-metal SVP installations.

## Minimum requirements for installing the SVP software on customer-supplied server

Hitachi Vantara allows the SVP software to be installed on customer-supplied servers that meet the following minimum requirements.

- Processor:
  - One core with hyper-threading, two cores without hyper-threading
  - Processor performance comparable to Celeron 1.6 GHz
- Random-access memory: 3.5 GB per storage system
- Hard drive: 120 GB per storage system
- LAN connection: one 1000Base-T
- Windows 7 Professional (64-bit), Windows Server 2012 (64-bit), Windows Server 2012 R2 (64-bit), Windows Server 2016, Windows 10 Professional (64-bit), or Windows 10 Enterprise (64-bit)

**Note:** The customer-supplied server running the Windows operating system cannot be used with the storage system if it belongs to different subnets, and if a router or a firewall is filtering packets according to a defined condition. There is not a limit for distance between the server running the SVP application and storage array being managed if they belong to the same subnet.

## Setting up the SVP locale

The SVP and storage management software support the English and Japanese languages.

If you intend to install the SVP software using a language other than English and Japanese, change the SVP's locale setting to reflect the appropriate language using the procedure for the Windows version installed on the SVP. For more information, see the instructions for your Windows operating system.

## Configuring the operating system

The SVP runs on a customer-supplied version of Windows 7 Professional (64-bit), Windows Server 2012 (64-bit), Windows Server 2012 R2 (64-bit), Windows Server 2016 (64-bit), Windows 10 Professional (64-bit), or Windows 10 Enterprise (64-bit).

The following procedures describe how to configure the Windows 7 Professional (64-bit) operating system on the customer-supplied server. These procedures assume that the operating system has already been installed on the server.

## Logging on to the operating system

The log on procedure is performed using the Windows operating system installed on the SVP.

Using the Remote Desktop Connection, log on as the user who was specified during the Windows installation (for example, Administrator).

#### Next steps

Configure the Control Panel display.

## **Configuring the Control Panel display**

#### Procedure

- **1.** Open the Control Panel.
- 2. From the View by list, select Large icons.

**Note:** After configuring the control panel display, configure the desktop.

## Configuring the desktop

Configure the Windows screen saver function on the SVP.

#### Procedure

1. Click Control Panel > Personalization. For Basic and High Contrast Themes (6), click Windows Classic.

- 2. Click Screen saver.
- 3. In Screen saver, click Blank, and then set Wait to 60 (minutes).
- **4.** Click **OK**.

- 9. Click OK.
- **10.** In the **Taskbar and Start Menu Properties** window, click **OK**.

**Note:** After configuring the Task bar and Start Menu properties, configure the time settings.

## Configuring the time settings

Configure the SVP for Universal Coordinated Time, and then configure it to not synchronize with an Internet time server.

#### Procedure

- 1. Click Control Panel > Date and Time, and then click the Date and Time tab.
- 2. Click Change time zone.
- **3.** In the **Time Zone Settings** window, click **(UTC) Coordinated Universal Time**, and then click **OK**.
- 4. Click Control Panel > Date and Time, and then click the Internet Time tab.
- 5. Click Change settings. In the Internet Time Settings window, uncheck Synchronize with an Internet time server, and then click OK.
- 6. In the **Date and Time** window, click **OK**.

**Note:** After configuring the time settings, configure the region settings.

## **Configuring region settings**

Configure the region and language the language for your region or preference.

#### Procedure

1. Click Control Panel > Region and Language, and then click the Keyboards and Languages tab.

mats	Location	Keyboards and	d Languages Administrative

4. Restart the server.

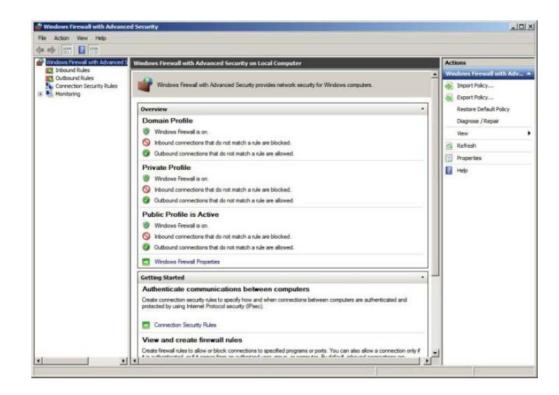

**Note:** After configuring the Registry, enable ICMP (ping) reply.

### Enabling ICMP (ping) reply

The Internet Control Message Protocol (ICMP) is a supporting protocol in the Internet protocol suite. The protocol is used by network devices, such as routers, to send error messages and operational information indicating, as an example, a requested service is not available or a host or router could not be reached.

### Procedure

1. Click Control Panel > Administrative Tools, and then start Windows Firewall with Advanced Security.

2. In the left pane, click Inbound Rules.

6. Click Restart Now.

Microsoft Windows		×
You must restart	your computer to apply th	iese changes
Before restarting, say	ve any open files and close all	programs.
	Restart Now	Restart Later

**7.** Wait for the server to restart.

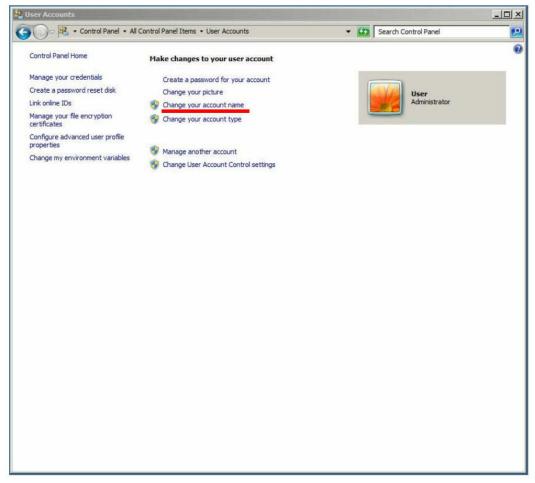

**Note:** After changing the computer name, change the account name.

### Changing the account name

The following user names might differ from the user name that was specified during the Windows installation.

#### Procedure

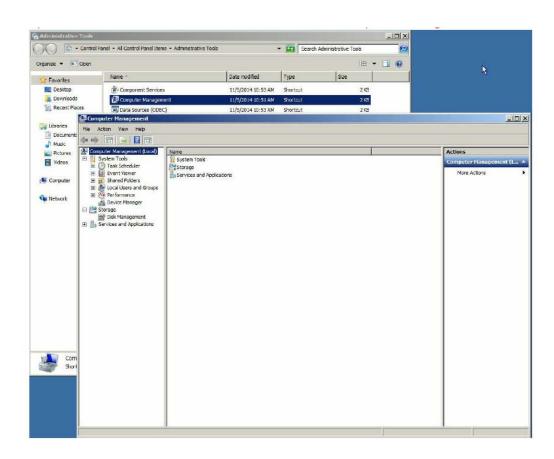

1. Click Control Panel > User Accounts, and then click Change your account name.

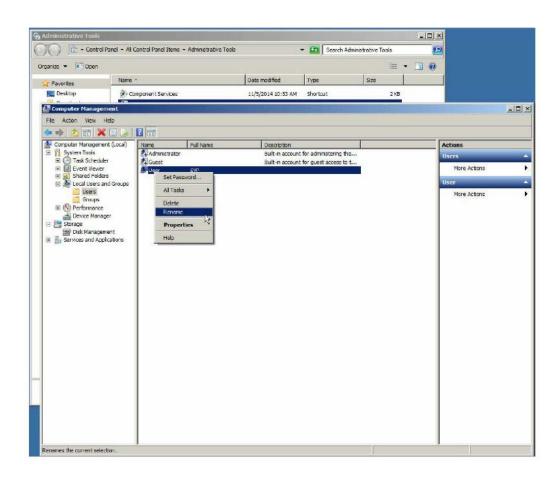

2. Type SVP for the new account name, and then click Change Name.

and the second s	_
Search Co	ntrol Panel
Type a new account name	
User Administrator	
SVP This name will appear on the Welcome screen and on the Start menu.	
Change Name	Cancel

- 3. Close the User Accounts window.
- 4. Click Control Panel > Administrative Tools, and then click Computer Management.

- 5. Click Computer Management (Local) > System Tools, and then click Local Users and Groups > Users.
- 6. In the right window, right-click **User**, and then click **Rename**.

7. Rename User to SVP.

- 4. Check the following check boxes:
  - FTP Server
    - FTP Extensibility
    - FTP Service
  - Web Management Tools
    - IIS 6 Management Compatibility
    - IIS 6 Scripting Tools
    - IIS 6 WMI Compatibility
    - IIS Metabase and IIS 6 configuration compatibility
    - IIS Management Console
    - IIS Management Scripts and Tools
    - IIS Management Service
- 5. Uncheck World Wide Web Services.

### Next steps

Install the SVP software.

## Installing the SVP software

You install the SVP software from the SVP ISO image for your storage system. This image is part of the microcode distribution set and has the file name **H8-SVP-XXX-XX.iso**.

### Procedure

- **1.** Obtain the appropriate SVP ISO image for your storage system from the firmware distribution set. Verify the ISO image corresponds to the firmware currently running on the storage system.
- **2.** Download the SVP ISO from TISC to the CE notebook, and then use an ISO reader to mount the SVP ISO as the next available drive letter.
- 3. Launch Remote Desktop Connection and click the **Show Options** drop-down menu.

4. Click the Local Resources tab, and then click More.

00	Connection
eneral D	isplay Local Resources Programs Experience Advanced
Remote au	udio Configure remote audio settings. Settings
Keyboard	Apply Windows key combinations:
~	Only when using the full screen   Example: ALT+TAB
Local devi	ces and resources
-	Choose the devices and resources that you want to use in your remote session.
	Printers Clipboard
	Mort.

- **5.** Expand **Drives**, and then check the drive that has the ISO.
- 6. Click Connect.
- 7. When prompted to enter your credentials, enter your SVP password and click **OK**.
- **8.** Perform the appropriate step:
  - If you have WinZip installed on the VM, extract the ISO locally, and then go to step 9 to run the setup application.
  - Otherwise, click the mapped drive in the left pane and double-click the **Setup** application in the workspace to the right of the pane (see the following figures), and then go to step 9.

**Note:** Using WinZip is the preferred method. The alternative method performs the installation over the network and can take significantly longer to complete.

## Chapter 6: Installing the SVP software on an Oracle Linux KVM host

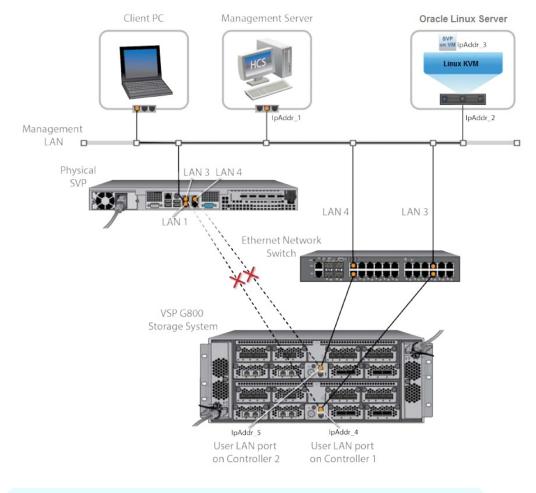

Hitachi Vantara supports configurations where a single SVP communicates with a single VSP Gx00 or VSP Fx00 model. This configuration can coexist with, or replace, all other physical, virtual, and bare-metal SVP configurations.

## Physical network connection for an Oracle Linux KVM-based SVP

SVP and storage system connections are performed using the ports on the back of these devices.

The following figure shows the physical network connection for an Oracle Linux KVMbased SVP configuration using the Hitachi Virtual Storage Platform G800. Adjust your connections appropriately if you use different VSP Gx00 models or VSP Fx00 models.

**Note:** The Oracle Linux KVM server running the VM instance cannot be used with the storage system if it belongs to different subnets, and if a router or a firewall is filtering packets according to a defined condition. There is no distance limit between the server running the SVP application and the storage array being managed if they belong to the same subnet.

**Note:** In this figure, the HCS instance can also run as a VM instance.

If the controllers are connected to a physical SVP, remove the Ethernet cables from the LAN3 and LAN4 ports on the SVP, and connect them to the network switch.

## Minimum requirements for an Oracle Linux KVM SVP

An SVP that will be used in an Oracle Linux KVM environment requires the following minimum requirements.

### Prerequisites

Linux KVM Server (provided by the customer)

- Oracle Linux 7.x server
- Two quad core processors, Intel Xeon 2.29 GHz
- One-port NIC
- SVP guest OS
- 128-GB RAM

SVP Guest OS (1 DKC) (maximum 1 DKC per SVP guest OS)

- Two vCPUs
- One virtual network adapter
- 4-GB RAM
- 120-GB disk space
- Windows 7 Professional (64-bit)

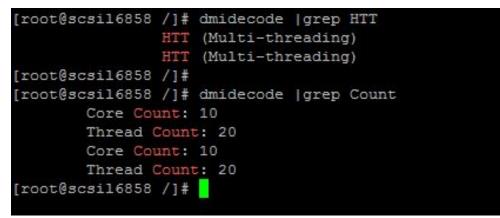

### Miscellaneous

WinZip

## Hyper-threading

Verify that hyper-threading is active for the Oracle Linux KVM server and VM guest host. (Hyper-threading is enabled by default.)

The following figure shows an example of hyper-threading on an Oracle Linux KVM server.

The following figure shows an example of hyper-threading on a VM guest host.

## Configuring the Oracle Linux KVM-based SVP

After preparing the environment, activating hyper-threading on both the Oracle Linux KVM server and VM guest host, and verifying the configuration layout, configure the SVP in the Oracle Linux KVM environment.

### Procedure

- **1.** On the Oracle Linux KVM host, create a VM that is appropriate for the Windows operating system being used.
- **2.** Verify that the virtual network connection is properly assigned to the appropriate virtual machine network.

## Where to go from here

To complete the installation, perform the following steps. For details, refer to the equivalent instructions for installing the SVP on a VMware ESXi host.

### Procedure

- **1.** Configure the SVP guest OS.
- **2.** Install the SVP software.
- **3.** Deploy a cloned virtual SVP (optional).
- **4.** Change the locale setting if the currently configured language is not appropriate.

# Chapter 7: Installing the SVP software on a VMware ESXi host

You can use a virtual SVP with the VSP Gx00 models and VSP Fx00 models. The virtual SVP is a software application that runs on either Windows 7 Professional x64 (64-bit) on a VMware ESXi 6.0.0 host or on Windows 7 Professional Service Pack 1 (64-bit) on a VMware ESXi 6.0 U2 host.

Observe the following guidelines when installing a virtual SVP:

- vSphere Cluster Failover: Due to the numerous vSphere server/cluster configurations and workloads, validate failover prior to placing the virtual SVP in production environments.
- Number of SVP virtual machines per vSphere cluster: One server supports up to eight VMs. Each VM can communicate independently with one storage system. Due to the wide variety of vSphere server/cluster configurations and workloads, perform simultaneous multi-system performance monitoring and log collections to verify trouble-free management.

To provide the highest level of trouble-free operations, observe the following rules:

- Do not locate a virtual machine on a storage system being managed by the same virtual machine.
- Do not start the SVP virtual machine from the storage system it is managing.

### Setting up the SVP locale

The SVP and storage management software support the English and Japanese languages.

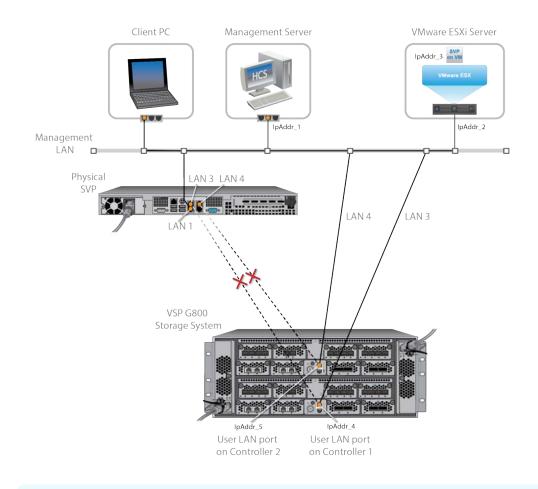

If you intend to install the SVP software using a language other than English and Japanese, change the SVP's locale setting to reflect the appropriate language using the procedure for the Windows version installed on the SVP. For more information, see the instructions for your Windows operating system.

## Network connection for virtual SVP

The SVP and storage system connection ports located at the rear of the components.

The following figure shows the physical network connection for a virtual SVP and Hitachi Virtual Storage Platform G800. Adjust your connections appropriately if using different VSP Gx00 models or VSP Fx00 models.

Chapter 7: Installing the SVP software on a VMware ESXi host

**Note:** The ESXi server running the VM instance cannot be used with the storage system they belong to different subnets, and if a router or a firewall is filtering packets according to a defined condition. There is no distance limit between the server running the SVP application and the storage array being managed if they belong to the same subnet.

### **Virtual SVP requirements**

The virtual SVP must meet the following minimum requirements.

ESX Server (provided by the customer)

- VMware ESXi server 6.x
- Two quad core processors, Intel Xeon 2.29 GHz
- One port network interface card (NIC)
- SVP guest OS
- 32 GB RAM

Chapter 7: Installing the SVP software on a VMware ESXi host

SVP Guest OS (maximum one DKC per SVP guest OS)

- Two virtual CPUs
- One virtual network adapter
- 4 GB RAM
- 120 GB disk space
- One of the following 64-bit operating systems:
  - For VMware ESXi 6.0.0: Windows 7 Professional (64-bit)
  - For VMware ESXi 6.0 U2: Windows 7 Professional Service Pack 1 (64-bit)

#### Miscellaneous

WinZip

# Hyper-threading

To support a virtual SVP, verify that hyper-threading is active for the ESXi server and VM guest host.

**Note:** Hyper-threading is enabled by default.

# Configuring the SVP guest OS

The following procedures describe how to configure the SVP guest OS. Before you begin, ensure Hyper-Threading is active for the ESXi server and VM guest host is configured.

## Logging on to the operating system

Using the Remote Desktop Connection, log on as the specified user assigned during the guest OS installation (for example, Administrator).

After logging on successfully, configure the control panel display.

## **Configuring the Control Panel display**

### Procedure

- **1.** Open the Control Panel.
- 2. From the View by list, select Large icons.

**Note:** After configuring the control panel display, configure the desktop.

## **Configuring the desktop**

Configure the Windows screen saver function on the SVP.

### Procedure

1. Click Control Panel > Personalization. For Basic and High Contrast Themes (6), click Windows Classic.

- 2. Click Screen saver.
- 3. In Screen saver, click Blank, and then set Wait to 60 (minutes).
- 4. Click **OK**.

- 9. Click OK.
- **10.** In the **Taskbar and Start Menu Properties** window, click **OK**.

**Note:** After configuring the Task bar and Start Menu properties, configure the time settings.

## Configuring the time settings

Configure the SVP for Universal Coordinated Time, and then configure it to not synchronize with an Internet time server.

### Procedure

- 1. Click Control Panel > Date and Time, and then click the Date and Time tab.
- 2. Click Change time zone.
- **3.** In the **Time Zone Settings** window, click **(UTC) Coordinated Universal Time**, and then click **OK**.
- 4. Click Control Panel > Date and Time, and then click the Internet Time tab.
- 5. Click Change settings. In the Internet Time Settings window, uncheck Synchronize with an Internet time server, and then click OK.
- 6. In the **Date and Time** window, click **OK**.

**Note:** After configuring the time settings, configure the region settings.

## **Configuring region settings**

Configure the region and language the language for your region or preference.

### Procedure

1. Click Control Panel > Region and Language, and then click the Keyboards and Languages tab.

mats	Location	Keyboards and	d Languages Administrative
Keybo	oards and	other input la	nguages
To ch	nange you	ir keyboard or	input language click Change keyboards.

4. Restart the server.

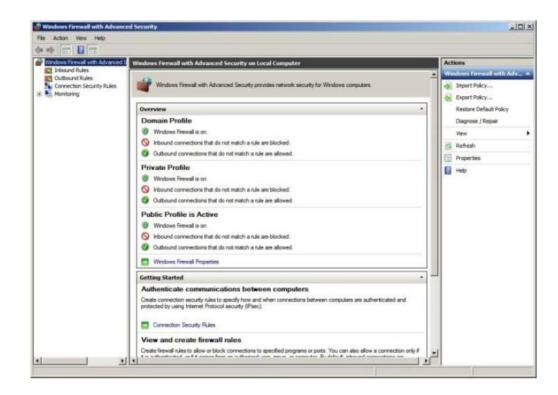

**Note:** After configuring the Registry, enable ICMP (ping) reply.

## Enabling ICMP (ping) reply

The Internet Control Message Protocol (ICMP) is a supporting protocol in the Internet protocol suite. The protocol is used by network devices, such as routers, to send error messages and operational information indicating, as an example, a requested service is not available or a host or router could not be reached.

#### Procedure

1. Click Control Panel > Administrative Tools, and then start Windows Firewall with Advanced Security.

2. In the left pane, click Inbound Rules.

Windows Firewall with Advanced S	Inbound Rules					Actions

	Restart Now	Restart Later

**7.** Wait for the server to restart.

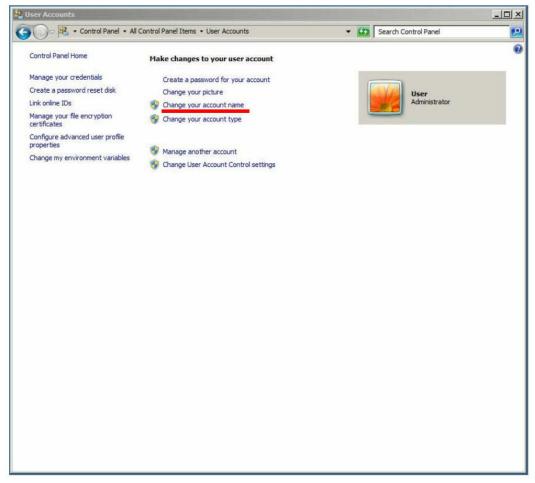

**Note:** After changing the computer name, change the account name.

### Changing the account name

The following user names might differ from the user name that was specified during the Windows installation.

#### Procedure

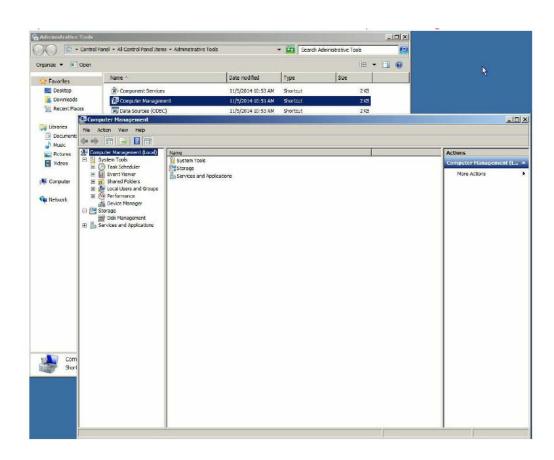

1. Click Control Panel > User Accounts, and then click Change your account name.

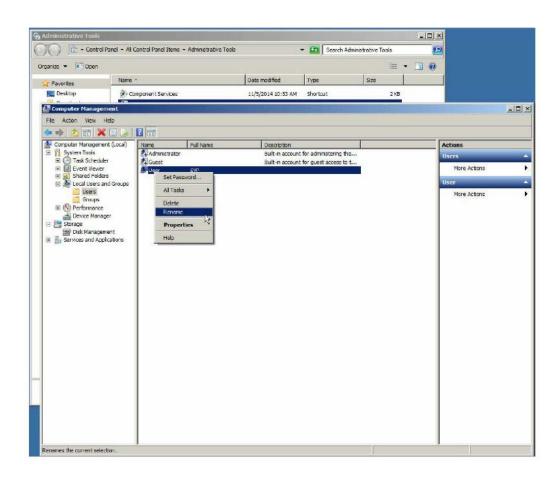

2. Type SVP for the new account name, and then click Change Name.

and the change Your Name	
🚱 🕞 🕫 🔹 Control Panel 🔹 All Control Panel Items 🔹 User Accounts 🔹 Change Your Name 🔹 😨 Search Control Panel	<b>1</b>
Type a new account name User Administrator	
SVP This name will appear on the Welcome screen and on the Start menu.	
Change Name Cancel	

- **3.** Close the **User Accounts** window.
- 4. Click Control Panel > Administrative Tools, and then click Computer Management.

- 5. Click Computer Management (Local) > System Tools, and then click Local Users and Groups > Users.
- 6. In the right window, right-click **User**, and then click **Rename**.

7. Rename User to SVP.

- 7. Close the **Computer Management** window, and then close the **Administrative Tools** window.
- 8. Restart Windows.

Ē

**Note:** After configuring the password setting for Administrator, change the password setting.

### Changing the password setting

Change the password for the Windows operating system running on the SVP.

#### Procedure

- 1. Click Control Panel > User Accounts.
- 2. Click Create a password for your account.
- **3.** In the top two fields, type the password raid-login. Leave the password hint field empty.

a Create Your Password				<u>_     ×</u>
S + All Control Panel Items + User Accounts + Create Your Password	•	-	Search Control Panel	
Create a password for your account				
If your password contains capital letters, they must be typed the same way of How to create a strong password	every tim	e you	log cn.	
Type a password hint The password hint will be visible to everyone who uses this computer. What is a password hint?				
	Cr	eate p	assword Cancel	

- 4. Click Create password.
- 5. Close the window.

**Note:** After changing the password setting, install the SVP software.

### Installing the SVP software

You install the SVP software from the SVP ISO image for your storage system. This image is part of the microcode distribution set and has the file name **H8-SVP-XXX-XX.iso**.

#### Procedure

- **1.** Obtain the appropriate SVP ISO image for your storage system from the firmware distribution set. Verify the ISO image corresponds to the firmware currently running on the storage system.
- **2.** Download the SVP ISO from TISC to the CE notebook, and then use an ISO reader to mount the SVP ISO as the next available drive letter.
- 3. Launch Remote Desktop Connection and click the **Show Options** drop-down menu.

4. Click the Local Resources tab, and then click More.

260	Connection
eneral   D	isplay Local Resources Programs Experience Advance
Remote al.	udio Configure remote audio settings. Settings
Keyboard	Apply Windows key combinations:
V	Only when using the full screen
.ocal devi	ces and resources
-	Choose the devices and resources that you want to use in your remote session.
	Printers Clipboard
	Mor

- **5.** Expand **Drives**, and then check the drive that has the ISO.
- 6. Click Connect.
- 7. When prompted to enter your credentials, enter your SVP password and click **OK**.
- **8.** Perform the appropriate step:
  - If you have WinZip installed on the VM, extract the ISO locally, and then go to step 9 to run the setup application.
  - Otherwise, click the mapped drive in the left pane and double-click the **Setup** application in the workspace to the right of the pane (see the following figures), and then go to step 9.

**Note:** Using WinZip is the preferred method. The alternative method performs the installation over the network and can take significantly longer to complete.

**17.** On the Desktop, click the **Open StorageDevice List** shortcut.

Wait 10-15 minutes for all the services to start.

**18.** After the services are ready, click the storage system to start Hitachi Device Manager - Storage Navigator.

# Deploying a cloned virtual SVP

To avoid management outages for the working storage system, clone a virtual SVP image to an unregistered storage system.

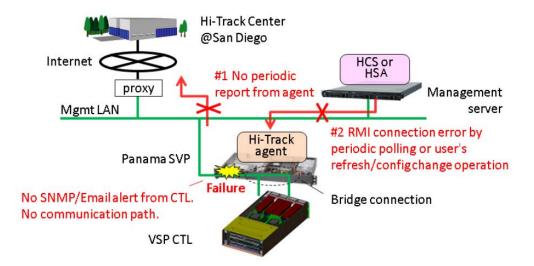

#### Procedure

- **1.** Prepare a master virtual SVP image:
  - a. Create the virtual SVP using the procedure in <u>Configuring the virtual SVP (on page 109)</u>. You do not have to set up the network at this time.
  - b. Configure the SVP guest OS using the procedure in <u>Configuring the SVP guest</u> OS (on page 112).
  - c. Install the SVP using the procedure in <u>Completing the configuration (on page 92)</u>. You do not have to configure the SVP IP address at this time. In addition, do not register a DKC using the Storage Device List.
- **2.** Turn off the master virtual SVP.
- 3. Clone the master virtual SVP, and then start the cloned virtual SVP.
- 4. Configure the Windows OS network information in the cloned virtual SVP.
- **5.** Set the IP address for the SVP. This IP address is used to communicate with the storage system.
- 6. Register a storage system using the Storage Device List.

## **Detecting SVP failures**

SVP failures are detected and resolved using the following methods.

Failure detection method	How a failure is detected	Action to be taken
Hi-Track Remote Monitoring System	No report from the agent during a 24-hour health check	Hi-Track detects SVP failure -> SVP replacement. For information about Hi-Track, go to the Hi-Track website: <u>http://hitrack.hds.com/</u> .
Hitachi Command Suite (HCS)	RMI connection error (not alert)	See the <i>Hitachi Command</i> <i>Suite Administrator Guide</i> (MK-90HC175).
Hitachi Storage Advisor (HSA)	Hardware alerts appear in Alert tiles, along with drill- down views for detailed information.	See Hitachi Storage Advisor User Guide (MK-94HSA004).

# Chapter 8: Installing the SVP software on a Microsoft Hyper-V Server 2012 R2 Virtual Machine

You can install the SVP software on a Windows Server 2012 R2 (64-bit), Windows Server 2016 (64-bit) or Windows 10 Enterprise (64-bit) operating system running on a Microsoft Hyper-V Server 2012 R2 Virtual Machine (VM).

## Setting up the SVP locale

The SVP and storage management software support the English and Japanese languages.

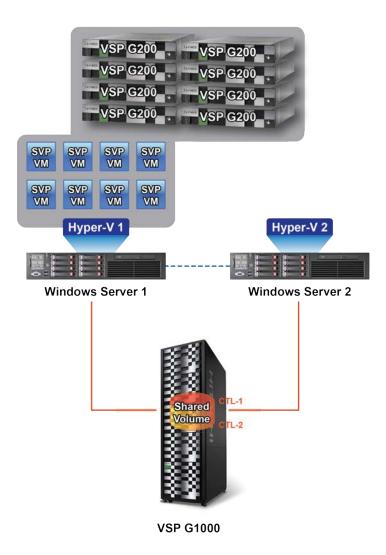

If you intend to install the SVP software using a language other than English and Japanese, change the SVP's locale setting to reflect the appropriate language using the procedure for the Windows version installed on the SVP. For more information, see the instructions for your Windows operating system.

### **Network connection for Hyper-V**

The following figure shows a high-level view of a Hyper-V VM implementation and migration in a non-clustered environment. In this example, eight Hitachi Virtual Storage Platform G200 storage systems are connected to a Windows server designated Hyper-V1. The Hyper-V1 server is running eight instances of SVP VMs (one for each VSP G200 storage system) and is connected to a second Windows server (Hyper-V2) that is also running Hyper-V. Both the Hyper-V1 and Hyper-V2 servers have their own connection to a Hitachi Virtual Storage Platform G1000 storage system.

Ë

**Note:** The Hyper-V server running the VM instance cannot be used with the storage system if it belongs to different subnets, and if a router or a firewall is filtering packets according to a defined condition. There is no distance limit between the server running the SVP application and the storage array being managed if they belong to the same subnet.

# Minimum requirements for Hyper-V Server 2012 R2 VM

A host that runs the SVP software on a customer-supplied Microsoft Hyper-V Server 2012 R2 VM requires the following minimum requirements.

- Hyper-V Server Windows 2012R supplied by the customer
- Two quad core processors, Intel Xeon 2.29 GHz
- One-port NIC
- SVP guest OS
- 32-GB RAM

The SVP guest (1 DKC) (maximum one DKC per SVP guest OS)

- Two vCPUs
- One virtual network adapter
- 4-GB RAM
- 120-GB disk space
- One of the following 64-bit operating systems:
  - Windows 10 Professional
  - Windows 10 Enterprise
  - Windows Server 2012
  - Windows Server 2012 R2
  - Windows Server 2016

To use Hyper-V Manager successfully, you must first configure your hosts correctly. In particular, confirm that each host:

- Is licensed for Windows 2012R2 OS.
- Meets the shared storage requirements for Hyper-V Management.
- Meets the networking requirements for Hyper-V Management.

### Installing and Configuring Hyper-V on Windows 2012 R2 Server

When you install and configure a customer-supplied version of Microsoft Hyper-V on Windows 2012 R2 Server, you configure the virtual switch. A virtual switch allows VMs created on Hyper-V hosts to communicate with other computers. You can also configure the default stores. Default stores are default locations for storing virtual hard disk files and virtual configuration files.

In the following procedure, you will define virtual switch settings. However, you will accept the default settings for the default stores; you can specify different locations later by modifying the Hyper-V settings.

#### Procedure

- 1. Go to Start > Programs, and then click Administrative Tools > Server Manager.
- 2. In the Dashboard, click Add roles and features.

**3.** In the left pane of the **Add Roles and Features Wizard** window, click **Hyper-V** > **Virtual Switches**. Then check the appropriate Ethernet controller.

### Installing the SVP software on a guest OS

After you perform the host configuration, install the SVP software on a guest OS.

You install the SVP software using Hitachi Device Manager - Storage Navigator.

#### Procedure

- 1. Double-click the Setup.exe file for Device Manager Storage Navigator.
- 2. When prompted, select a language and accept the license agreement.

**3.** Accept the default directory or select a different one, and then click **OK**.

3	Hitachi Device Manager - Storage Navigator	_ 🗆 X
Hitachi Device	Manager - Storage Navigator	
	Hitachi Device Manager - Storage Navigator	
	Choose Destination Location	
	Select folder where setup will install files.	
	Setup will install Hitachi Device Manager - Storage Navigator in the following folder.	
	To install to this folder, click Next. To install to a different folder, click Browse and select another folder.	
	Destination Folder C:Mapp Browse	
	InstallShield	
	OK. Cancel	

**4.** Select the IP addressing method (IPv4 or IPv5), enter the IP address of the SVP port connecting the SVP and the storage system, and then click **Apply**.

7. Confirm that the storage system appears in the Storage Device List.

This completes the procedure for installing the SVP software on a guest OS. If you need to modify your configuration, refer to the instructions for installing the SVP on a VMware ESXi host.

# **Chapter 9: Upgrading the SVP software**

The following instructions describe how to upgrade the SVP software. Procedures are provided for upgrading the SVP software only, or installing the SVP software, Device Manager - Storage Navigator, and storage system firmware at the same time.

**Important:** The Hitachi Vantara-supplied SVP can only be installed, upgraded, or replaced by a Hitachi Vantara representative or an authorized service provider. Contact a Hitachi Vantara representative for more information about installing, upgrading, or replacing a Hitachi Vantara-supplied SVP.

**Note:** Before upgrading the SVP software:

- Back up your SVP configuration. For details about backing up your SVP configuration, see <u>Backing up the SVP configuration (on page 248)</u>.
- Disable the Hi-Track Remote Monitoring System. Otherwise, the upgrade procedure fails. You can enable Hi-Track after you upgrade the SVP software using Storage Device List.
- View all active alerts (see <u>https://support.hitachivantara.com/en\_us/</u> <u>contact-us.html</u>).

### Stopping the service in each storage system

You must stop the service to upgrade the SVP software. After the software is upgraded, you can restart the service.

In the following cases, all the storage systems with **Ready** service status must be stopped in the Storage Device List.

- Update the SVP software.
- Start services on storage systems running **S/W Version** 83-01-xx or later.

To stop the service, perform the following procedure from the PC connected to the SVP.

#### Procedure

1. In the **Storage Device List** window, click **Stop Service** of the storage system where you want to stop the service.

Chapter 9: Upgrading the SVP software

Note: When the storage system with **S/W Version** 83-01-xx or later is registered, set all the registered storage systems so that they do not start services automatically when restarting the SVP. For more information, see <u>Changing storage system information in the Storage Device List (on page 210)</u>.

The Stop Service screen opens.

Stop Servi	ce		
i	Please confir	m to stop service	r.
		Confirm	Cancel

2. Click Confirm.

**Note:** To resume service, in the **Storage Device List** window, click **Start Service** of the storage system where you want to start the service.

# Upgrading the SVP software only

This procedure describes how to upgrade the SVP software, without upgrading the storage management software and storage system firmware. This procedure can be used with storage systems that have firmware version 83-01-21 or later.

This procedure assumes that the storage system is operating and that a console PC is connected to the SVP using Remote Desktop Client.

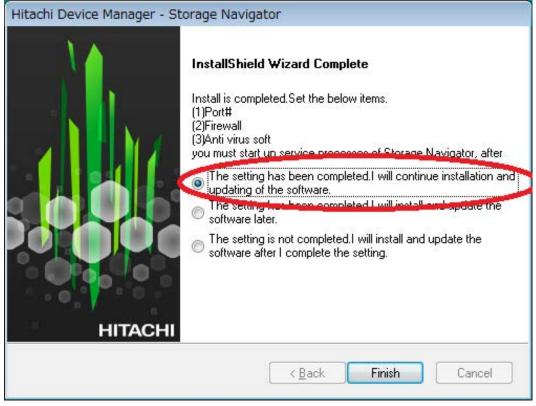

Chapter 9: Upgrading the SVP software

**Note:** Before upgrading the SVP software:

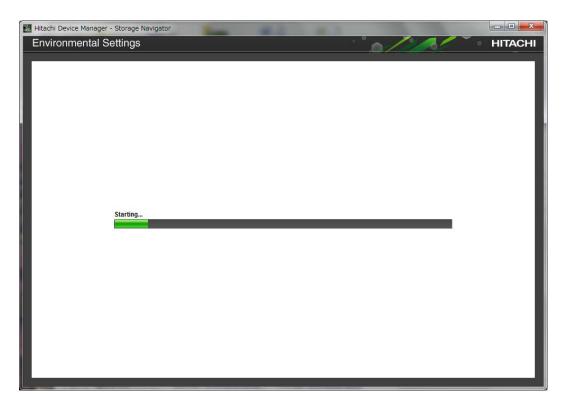

- Disable the Hi-Track Remote Monitoring System (see <u>http://</u><u>hitrack.hds.com</u>); otherwise, the upgrade procedure will fail. You can enable Hi-Track after you upgrade the SVP software.
- View all active alerts (see <u>https://support.hitachivantara.com/en\_us/</u> <u>contact-us.html</u>).

#### Procedure

- **1.** At the console PC connected to the physical SVP or running the SVP software, insert the SVP software media.
- **2.** On the SVP, create a new folder, and then copy all of the files from the SVP software media into the new folder.
- 3. In the new folder, right-click the Setup.exe file and click Execute as Administrator.
- 4. In the following screens, click Next, accept the license agreement, and click Next, and then click Yes. If the Windows Security Alert window opens, click Allow access. In the following screen, click the top option, as shown, and then click Finish.

The **Environmental Settings** window opens as the system prepares for the upgrade.

- **5.** Wait for the preparation to complete and for the target storage systems list window to open.
- **6.** When the target storage systems list window opens, select the appropriate storage systems, and then click **Select Update Objects**.

## Upgrading the storage management, SVP software, and storage system firmware

The following procedure describes how to upgrade the SVP software, Device Manager - Storage Navigator, and storage system firmware.

#### **Before you begin**

This procedure assumes the storage system is operating and a console PC is connected to the SVP through Remote Desktop Client.

- Disable the Hi-Track Remote Monitoring System otherwise, the upgrade procedure fails. Enable Hi-Track after the SVP software upgrade is complete.
- View all active alerts (see <u>https://support.hitachivantara.com/en\_us/contact-us.html</u>).

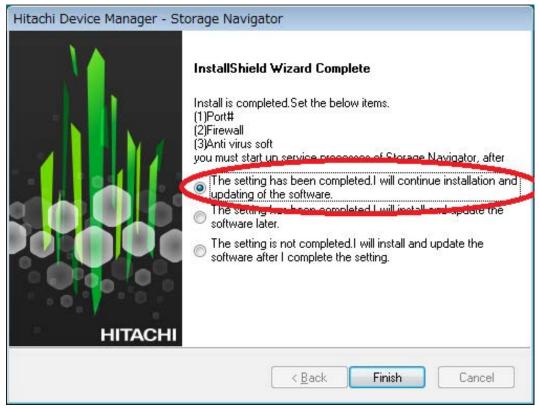

**Note:** This upgrade time is approximately 3.5 hours for storage systems with firmware version 83-01-21 or later.

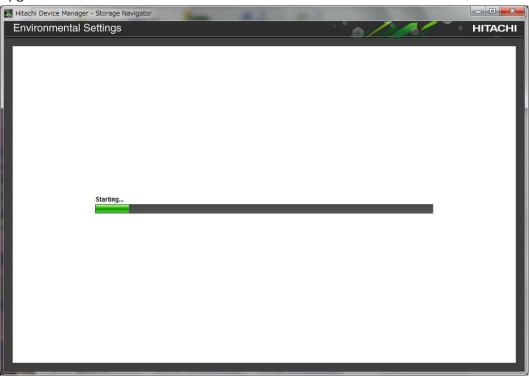

**Note:** The upgrade time can take up to 9 hours to complete when NAS modules are installed.

#### Procedure

- **1.** On the console PC connected to the physical SVP or running the SVP software, insert the SVP software media.
- **2.** On the SVP, create a new folder, and then copy all the files from the SVP software media into the new folder.
- **3.** In the new folder, right-click the Setup.exe file, and click **Execute as Administrator**.
- 4. In the following screens, click Next, accept the license agreement, and click Next, and then click Yes. If the Windows Security Alert window opens, click Allow access. In the following screen, click the top option and then click Finish.

The **Environmental Settings** window opens as the system prepares for the upgrade.

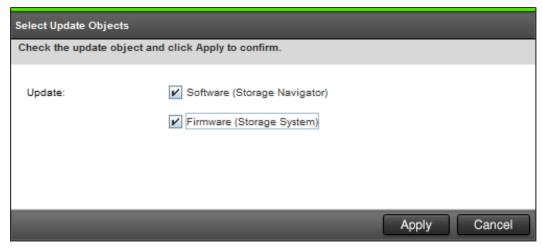

**5.** Wait for the preparation to complete and for the target storage systems list window to open.

**6.** When the target storage systems list window opens, select the appropriate storage systems, and then click **Select Update Objects**.

- **16.** In the **Environmental Settings** window, click **Close**.
- **17.** At the **Confirm exit** window, click **Confirm**.

#### Stopping the SVP service

Before upgrading the SVP software, stop the SVP service.

#### Procedure

- **1.** Connect the management console PC attached to the SVP, connect to the SVP using Windows Remote Desktop Client.
- 2. On the SVP, click Start > All Programs > Hitachi Device Manager-Storage Navigator > StorageDeviceList. The Storage Device List window opens.
- 3. In the Storage Device List window, record the S/W Version:\_\_\_\_\_
- **4.** Click the **Stop Service** button for the registered storage system in the **Storage Device List** window.

5. In the confirmation message, click the **Confirm** button.

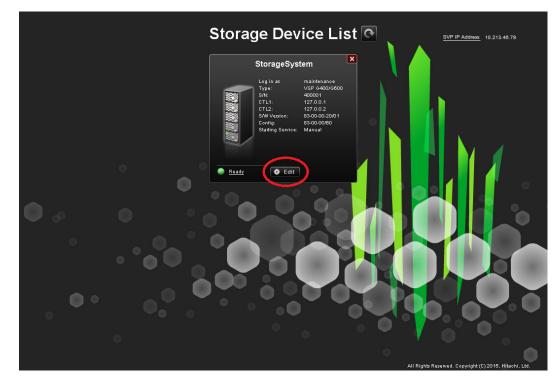

6. Proceed to <u>Upgrading the software (on page 190)</u>.

### Upgrading the SVP software using Storage Device List

After stopping the SVP service, upgrade the SVP software. You can specify the SVP service to restart when the SVP is restarted. Store the new SVP software file in a location that can be accessed by the PC.

#### Procedure

- On the SVP, click Start > All Programs > Hitachi Device Manager-Storage Navigator > StorageDeviceList. The Storage Device List window opens.
- **2.** In the **Storage Device List** window, click **Edit** for the storage system whose SVP software you want to upgrade.

3. In the Edit System window, select Software and click Browse.

Software:			
Software Selection:			Browse
10.000	_		
Connect Information: IP Address (CTL1):	IPv4	Q IPv6	
IP Address (CTL2):	(i) IPv4	O IPv6	
	( Maoc, 180 oha	aracters)	
System Name:	( Maoc, 180 oha	macters )	
Description:			
Description:	( Max, 180 cha	aracters, or blank )	
Description:	(Mao, 180 cha	aracters, or blank )	
20	( Maoc, 180 oha	aracters, or blank )	
User Information:	( Max, 180 cha ( Max, 256 cha		
User Information:			
User Information: User Name:		aracters)	

- 4. Go to the location where you downloaded the software file (for example, Software \productname.inf), click the software file, and then click **Open**.
- 5. At the bottom of the Edit System window, check Start service automatically, when the SVP is rebooted.
- 6. Click Apply.
- 7. In the **Storage Device List** window, verify that the software version shown is later than the version you recorded prior to the upgrade.

**Note:** If the update firmware window does not appear while upgrading the software, close the error window, and then update the software again.

**8.** If you disabled the Hi-Track Remote Monitoring System, go to the Hi-Track website and enable it (see <u>http://hitrack.hds.com</u>).

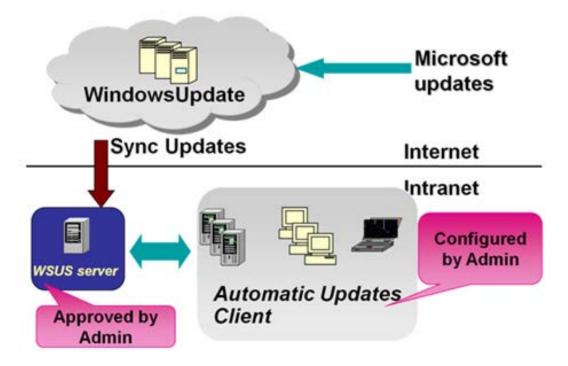

## Downgrading the SVP software

Before downgrading the SVP software, contact the customer support.

# Chapter 10: Security patch and antivirus software

Hitachi Vantara provides a list of suggested antivirus software applications for the SVP. Administrators perform the necessary security measures by applying antivirus software, Windows updates, and security patches according to their internal security policies.

Users apply security patches using a Windows Server Update Services server. Users can also apply security patches using a Windows Server Update Services server.

For the latest antivirus details, see the *SVP* (*Service Processor*) *OS* and *Hypervisor support* for *Gx00*, *Fx00* report at <u>https://support.hitachivantara.com/en\_us/interoperability.html</u>.

## **Online update**

Users with storage systems in an online environment can apply security patches using automatic or manual Windows updates.

Chapter 10: Security patch and antivirus software

Change settings		
🜀 🕦 - Control Panel - Al Control Panel Items - Windows Update - Change settings	✓ GD Search Control

Windows Server 2012	https://www.microsoft.com/en-us/ download/details.aspx?id=35626		

## Installing antivirus software on the SVP

Installing antivirus software might affect SVP performance. Therefore, install antivirus software according to the following procedure.

Chapter 10: Security patch and antivirus software

For the latest antivirus details, see the *SVP* (*Service Processor*) *OS* and *Hypervisor* support for *Gx00*, *Fx00* report at <u>https://support.hitachivantara.com/en\_us/interoperability.html</u>.

When you install antivirus software on the SVP, observe the following guidelines:

- Do not perform other maintenance operations. Doing so can delay processing or result in an error.
- Do not access the storage system or perform operations from remote sites using applications such as Hitachi Device Manager - Storage Navigator. Doing so can delay processing or result in an error.
- When the SVP restarts during installation, data and logs monitored by the service information message or sense byte (SIM/SSB) might be interrupted temporarily.

#### Procedure

- 1. Log on to the SVP.
- **2.** Install the antivirus software. If the SVP restarts, log on to the SVP again. If the SVP does not restart, restart the SVP manually, and then log on to it .
- **3.** Open the maintenance utility window and verify that there is no failure.

## **Chapter 11: Setting up SSL encryption**

You can set up a Secure Sockets Layer (SSL) connection between the storage system and the SVP.

SSL encrypts the Hitachi Device Manager - Storage Navigator user ID and password exchanged between the storage system and SVP.

## About SSL

SSL is a protocol for transmitting data securely over the Internet. Two SSL-enabled peers use their private key and public key to establish a secure communication session, with each peer encrypting transmitted data with a randomly generated and agreed-upon symmetric key.

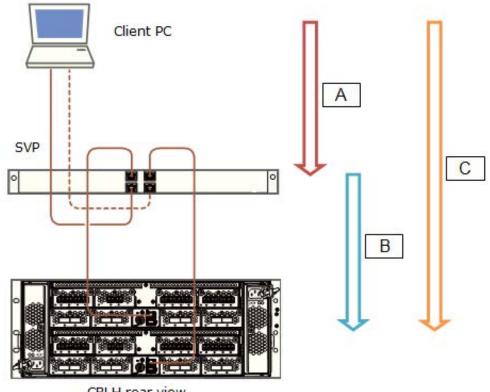

The following terms are associated with SSL:

- Keypair: A keypair is two mathematically related cryptographic keys consisting of a private key and its associated public key.
- Server certificate: A server certificate forms an association between an identity (in this case, the SVP server) and a specific public key and private key. A server certificate is used to identify the SVP server to a client, so that the server and client can communicate using SSL. Certificates can be self-signed or issued by a certificate authority (CA). Self-signed certificates are generated by you, and the subject of the certificate is the same as the issuer of the certificate. A client PC and SVP on an internal LAN behind a firewall might provide sufficient security. Certificates issued by the CA are signed and trusted server certificates, where a Certificate Signing Request (CSR) is sent to and certified by a trusted CA such as VeriSign. Using a certificate from a CA provides higher reliability than a self-signed certificate, but is also more expensive and can include several requirements.

## SSL encryption of the storage system

The storage system uses SSL encryption for three connection paths. These paths are designated A to C in the following table and figure.

Connection path in figure	Connection path description	Encryption purpose	Certificate to be used
A	Between the SVP and client PC	Operation of Device Manager - Storage Navigator	A signed certificate of SSL encryption between the SVP and client PC
В	Between the SVP and storage system	SVP exchanges the information with the storage system	The certificate for "Connect to SVP" and the certificate for "Web server"
С	Between the client PC and storage system	Operation of maintenance utility	The certificate for "Web server"

**CBLH** rear view

To prevent a man-in-the middle attack, the encryption shown in notation B (between SVP and storage system) verifies the validity of the connection by using the certificate that was uploaded to the SVP in advance and by using the certificate of the storage system. The same certificate must be uploaded to the SVP and the storage system.

**Note:** If a certificate for the SVP or the storage system is changed, the SVP does not operate normally. Upload the certificate to the storage system before uploading the certificate to the SVP.

Different certificates can be used to connect to the SVP and web server.

Certificate	Upload destination	Comments
A signed certificate of SSL encryption between the SVP and client PC	SVP	N/A
For connecting to the SVP	SVP and storage system	If a certificate for the SVP or the storage system was uploaded, the SVP will not operate normally.
For connecting to the web server	SVP and storage system	If a certificate for the SVP or storage system was uploaded, the SVP will not operate normally.

Creating private and public keys requires a dedicated program, such as those you can download from the OpenSSL website.

## Setting up SSL communications

In the following procedure, you create private and public keys using a dedicated program, such as those you can download form the OpenSSL website.

#### Procedure

Ë

- 1. Download OpenSSL.
- 2. Create a private key.
- **3.** Create a public key.
- **4.** Acquire a signed certificate.
- **5.** Upload the signed SSL certificate.
- 6. Import the certificate into the web browser (optional).
- 7. Block HTTP communications.

## Updating the SVP server certificate

Updating the SVP certificate renders some tasks temporarily unavailable.

- While the SVP server certificate is being updated, tasks that are being performed or scheduled to be performed on Device Manager Storage Navigator are not executed.
- Certificates for RMI communication are updated asynchronously (within approximately two minutes).
- If an SVP certificate is updated during Hitachi Command Suite setup operation, the setup operation results in an error.
- Updating the SSL certificate may cause an SVP failure. Therefore exercise care to keep the certificate and private key consistent.
- After the certificate update completes, the SVP server can take 30 to 60 minutes to restart, depending on the environment. A long period of time can cause an internal server error without displaying the update completion dialog box does. Despite this behavior, the certificate update completes.

## Creating a private key (.key file)

A private key is required to create an SSL keypair.

#### Procedure

- Download and install the openssl.exe file from the OpenSSL website. In the following example, the openssl.exe file is installed to the c:\openssl folder.
- 2. If the read-only attribute is set, remove this attribute from the c:\openssl folder.
- **3.** Open a command prompt.
- **4.** Move the current directory to the folder to which the key file is output, such as c:\key.
- 5. Execute the following command: c:\key > c:\openssl\bin\openssl genrsa -out server.key 2048 A file called server.key is created in the c:\key folder. This file becomes the private key.

## Creating a public key (.csr file)

A public key is required to create an SSL keypair.

#### Procedure

1. Open a command prompt and issue the following command: C:\key >
 c:\openssl\bin\openssl req -sha256 -new -key server.key -config
 c:\openssl\bin\openssl.cfg -out server.csr

Chapter 11: Setting up SSL encryption

Service Processor Technical Reference

This command uses SHA-256 as a hash algorithm. The server.csr file is created in the C:\key folder as a public key.

**Note:** Do not use MD5 or SHA-1 for a hash algorithm due to its low security level. Use SHA-256 for a hash algorithm.

- 2. Enter the following information in the prompt:
  - Country Name (two-letter code)
  - State or Province Name
  - Locality Name
  - Organization Name
  - Organization Unit Name
  - Common Name
  - To create a self-signed certificate, enter the IP address of the server (SVP). The name you entered here is used as the server name (host name). To obtain a signed and trusted certificate, verify that the server name matches the host name of the SVP.
  - Email Address
  - Challenge password (optional)
  - Company name (optional)

The following example shows a sample command prompt input.

```
..++++++
is 65537 (0x10001)
C:\key>c:\openssl\bin\openssl reg -sha256 -new -key server.key -
config c
There are quite a few fields but you can leave some blank. You are
about to be asked to enter information that will be incorporated
into your certificate request. What you are about to enter is what
is called a Distinguished Name or a DN.
\openssl\bin\openssl.cfg -out server.csr
For some fields there will be a default value.
If you enter '.', the field will be left blank.
Country Name (2 letter code) [AU]:JP
State or Province Name (full name) [Some-State]:Kanagawa
Locality Name (eg, city) []:Odawara
Organization Name (eg, company) [Internet Widgits Pty Ltd]:Hitachi
Organization Unit Name (eg, section) []:ITPD
Common Name (eg, YOUR name) []:192.168.0.1
Email Address []:
Please enter the following 'extra' attributes
to be sent with your certificate request
A challenge password []:
```

## Acquiring a signed certificate for the private key

After creating a private key and a public key, acquire a signed certificate file for the public key.

There are three ways to acquire a signed certificate:

- Create a certificate by self-signing.
- Acquire a certificate of certificate authority that is used within your company.
- Acquire an official certificate by requesting one from a CA.

When you send a request to a certificate authority, specify SVP as the host name. There will be an extra charge.

Best practice is to use self-signed certificates only when testing encrypted communication.

To acquire a self-signed certificate:

#### Procedure

- **1.** Open a command prompt.
- 2. Issue the following command: c:\key>c:\openssl\bin\openssl x509 -req sha256 -days 10000 -in server.csr -signkey server.key -out
  server.crt

The validity period is set 10,000 days as an example. This command uses SHA-256 as a hash algorithm.

**Note:** Do not use MD5 or SHA-1 for a hash algorithm due to its low security level. Use SHA-256 for a hash algorithm.

## Acquiring a signed and trusted certificate

To acquire a signed and trusted certificate, you must acquire a CSR, send that file to a CA, and request the CA to issue a signed and trusted certificate.

Each certificate authority has its own procedures and requirements, and there is generally a cost for doing so. The signed and trusted certificate is the signed public key.

## Removing the passphrase from an SSL certificate

You cannot upload a passphrase-protected SSL certificate to the SVP. Before uploading a SSL certificate to the SVP, remove the passphrase from the SSL certificate.

The following procedure describes how to verify whether the passphrase is set and how to remove it.

#### Procedure

- 1. On the SVP, start a Windows command prompt as Administrator.
- 2. To verify a passphrase, move to the current directory to the folder (for example, C:\key) to store the key file, and then issue the following command: C:\key>c:\openssl\bin\openssl rsa -in [input\_key\_file] -out [output\_key\_file]

**Note:** If you issue this command, the key file is overwritten. Therefore, best practice is to back up a key file in advance and prepare the output or input directory of the key file separately.

- 3. You cannot upload a passphrase-protected SSL certificate to the SVP. Enter the passphrase that has been set and remove it using the command to verify a passphrase: C:\key>c:\openssl\bin\openssl rsa -in server.key -out server.key Enter pass phrase for server.key: Enter the passphrase. Writing RSA key
- **4.** If the path phrase entry is not required for the path phrase confirmation command, you can upload a SSL certificate to the SVP :
  - a. Issue the following command: C:\key>c:\openssl\bin\openssl rsa -in
     [input\_key\_file] -out [output\_key\_file].
  - b. Press the Enter key.
  - c. Issue the following command: Writing RSA key.
- 5. Verify that the path phrase is released, and then close the command prompt.

## Converting the SSL certificate into the PKCS#12 format

When uploading the created private key and the SSL certificate to the storage system, you must convert the certificate into the PKCS#12 format. If the SSL certificate is not uploaded to the storage system, the conversion is unnecessary.

**Note:** In this procedure, the file name of the private key is set as client.key and the file name of the SSL certificate, client.crt. In addition, the SSL certificate file in the PKCS#12 format is output to c:\key.

This procedure assumes that the private key and the SSL certificate are stored in the same folder, and that all users are logged out of Device Manager - Storage Navigator.

#### Procedure

- 1. On the SVP, start a Windows command prompt as Administrator.
- 2. Issue the following command: C:\key>c:\openssl\bin\openssl pkcs12 export -in client.crt -inkey client.key -out
  client.p12

- 3. Enter an arbitrary password. This password is used when uploading the SSL certificate in the PKCS#12 format to the storage system. The characters used for the password when creating the SSL certificate in the PKCS#12 format are shown as follows. and specified by the character string of 128 characters or less: A-Z a-z 0-9!# \$%&'()\*+,-./:;<=>?@[\]^\_`{|}~ The client.p12 file is created in the C:\key folder. This file is the SSC certificate converted into the PKCS#12 format.
- **4.** Close the command prompt.

## Uploading the signed server certificate of the SSL communication between the SVP and client PC

Upload the private key and the signed server certificate (public key) to the SVP for using an arbitrary certificate for SSL communications between the SVP and client PC.

The following describes how to upload the certificate using the certificate update tool. This procedure assumes that:

- A private key (server.key file) has been created. Change the file name to server.key unless the file already uses that name.
- A signed public key certificate (server.crt file) has been acquired. Change the file name to server.crt unless the file already has that name.
- All users are logged out of Device Manager Storage Navigator.

#### Procedure

- 1. On the SVP, start a Windows command prompt as Administrator.
- 2. Move the current directory to the directory where the certificate update tool (MappApacheCrtUpdate.bat) is located. Issue the following command: C:\MAPP \wk\Supervisor\MappIniSet\ MappApacheCrtUpdate.bat r[absolute path of the certificate file] r[absolute path of the private key file].

**Note:** C:  $\MAPP$  indicates the installation directory of the SVP. If you specify an installation directory other than C:  $\Mapp$ , replace C:  $\Mapp$  with the specified installation directory.

- 3. At the message Press any key to continue the process..., enter an arbitrary key.
- **4.** Close the command prompt.

## Returning the certificate of the SSL communication between the SVP and the client PC to the default

This procedure requires all users to log out of Device Manager - Storage Navigator.

#### **Procedure**

- 1. On the SVP, start a Windows command prompt as an Administrator.
- 2. Move the current directory to the directory where the tool (MappApacheCrtInit.bat) is located. Issue the following command: C: \MAPP\wk \Supervisor\MappIniSet\ MappApacheCrtInit.bat

**Note:** C: \MAPP indicates the installation directory of the SVP. If you specify an installation directory other than C: \Mapp, replace C: \Mapp with the specified installation directory.

- 3. At the message Press any key to continue the process..., enter an arbitrary key.
- **4.** Close the command prompt.

## Uploading the certificate to the SVP

To you use an arbitrary certificate for SSL communications between the SVP and storage system, upload the private key and the signed server certificate (public key) to the SVP.

This procedure assumes that:

- The private key of the storage system and the signed server certificate (public key) from the maintenance utility have been updated.
- The private key (server.key file) and the signed public key certificate (server.crt file) are in the X.509 PEM or X.509 DER format.
- All users are logged out of Device Manager Storage Navigator.

#### **Procedure**

- 1. On the SVP, start a Windows command prompt as Administrator.
- 2. Move the current directory to the directory where the certificate update tool (MappL7SwitchGumSslCrtUpdate.bat) is located. Issue the following command: C:\MAPP\wk\Supervisor\MappIniSet\ MappL7SwitchGumSslCrtUpdate.bat r[absolute path of the certificate file]

- **Note:** C: \MAPP indicates the installation directory of the SVP. If you specify an installation directory other than C: \Mapp, replace C: \Mapp with the specified installation directory.
- 3. At the message Press any key to continue the process..., enter an arbitrary key.
- **4.** Close the command prompt.

## Uploading the certificate to the web server

Execute the SSL communication with Device Manager - Storage Navigator installed on the SVP as a client and the controller of the storage system as a server. Upload the private key and the signed server certificate (public key) to the SVP for using the SSL communication. The following describes how to upload the certificate using the certificate update tool.

This procedure assumes that:

- The private key of the storage system and the signed server certificate (public key) for the web server from the maintenance utility have been updated.
- The private key (server.key file) and the signed public key certificate (server.crt file) are in X.509 PEM or X.509 DER format.
- All users are logged out of Device Manager Storage Navigator.

#### Procedure

- 1. On the SVP, start a Windows command prompt as Administrator.
- 2. Move the current directory to the directory where the certificate update tool (MappSn2GumSslCrtUpdate.bat) is located. Issue the following command: C:\MAPP\wk\Supervisor\MappIniSet\ MappSn2GumSslCrtUpdate.bat r[absolute path of the certificate file]

**Note:** C:\MAPP indicates the installation directory of the SVP. If you specify an installation directory other than C:\Mapp, replace C:\Mapp with the specified installation directory.

- 3. At the message Press any key to continue the process..., enter an arbitrary key.
- **4.** Close the command prompt.

## Returning the web server certificate to the default

If necessary, you can revert to the default web server certificate.

This procedure assumes that:

- The private key (server.key file) and the signed public key certificate (server.crt file) are in X.509 PEM or X.509 DER format.
- All users are logged out of Device Manager Storage Navigator.

#### Procedure

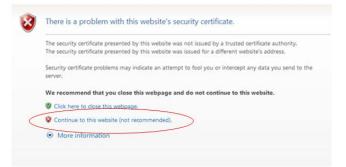

- 1. On the SVP, start a Windows command prompt as Administrator.
- 2. Move the current directory to the directory where the certificate update tool (MappSn2GumSslCrtInit.bat) is located. Issue the following command: C:\MAPP \wk\Supervisor\MappIniSet\MappSn2GumSslCrtInit.bat

**Note:** C: \MAPP indicates the installation directory of the SVP. If you specify an installation directory other than C: \Mapp, replace C: \Mapp with the specified installation directory.

- 3. At the message Press any key to continue the process..., enter an arbitrary key.
- **4.** Close the command prompt.

## **Resolving security certificate messages**

When starting an SSL-enabled Device Manager - Storage Navigator session, the following message appears if the security certificate was not issued by a trusted certificate authority. If the following alert message appears, click **Continue to this website (not recommended)**.

## **Blocking HTTP communications to the SVP**

You can block outside access to the HTTP communication port used by the SVP.

#### Procedure

- **1.** Request all users to log out of HDvM SN.
- **2.** Using a management console PC attached to the SVP, connect to the SVP using Windows Remote Desktop Client.
- 3. On the SVP, exit to a Windows command prompt as Administrator.
- 4. Move to the directory where the MappHttpBlock.bat tool is located, and then issue the following command:

C:\MAPP\wk\Supervisor\MappIniSet\MappHttpBlock.bat

In this command, C:  $\MAPP$  indicates the installation directory of the storage management software and SVP software. If the installation directory is different, replace C:  $\MAPP$  with the specified installation directory.

5. At the message Press any key to continue the process..., press any key, and then close the command prompt window.

## **Releasing HTTP communications to the SVP**

If you blocked outside access to the HTTP communications used by the SVP, use the following procedure to release the blocked port.

#### Procedure

- 1. Request all users to log out of HDvM SN.
- **2.** Using a management console PC attached to the SVP, connect to the SVP using Windows Remote Desktop Client.
- **3.** On the SVP, exit to a Windows command prompt as Administrator.
- 4. Move to the directory where the MappHttpBlock.bat tool is located, and then enter the following command:

C:\MAPP\wk\Supervisor\MappIniSet\MappHttpRelease.bat

In this command, C:  $\MAPP$  indicates the installation directory of the storage management software and SVP software. If the installation directory is different, replace C:  $\MAPP$  with the specified installation directory.

- 5. At the message Press any key to continue the process..., enter a port number that is not being used by another device or application.
- **6.** Close the command prompt window.

## **Chapter 12: Changing the storage IP address**

There might be times when you need to change the storage system's IP address. For convenience, there are two ways to change the IP address: using the maintenance utility on the SVP and using the Storage Device List.

## Using the SVP to set the storage system IP address

You can use the maintenance utility on the SVP to configure an IP address for the storage system.

#### Before you begin

Verify the storage system, SVP, and client PC are attached to the SVP and all are on the same subnet.

- Default IP address for controller 1 user LAN port: 192.168.0.16
- Default IP address for controller 2 user LAN port: 192.168.0.17
- Subnet mask: 255.255.255.0

#### Procedure

- **1.** Start the SVP, and then log on to it.
- 2. Configure the SVP to use a temporary port of 192.168.0.xxx, where xxx is a number from 1 to 254, excluding 16 and 17.
- **3.** Launch a web browser.
- 4. In the address bar, enter the IP address of controller 1.

When NAS modules are installed, the window for selecting Maintenance Utility or NAS Manager is displayed. Select **Maintenance Utility**.

The Maintenance Utility logon window opens.

- **5.** Log on to the maintenance utility using a user account that has administrative privileges.
- **6.** The first time you log on to the maintenance utility, enter a password for the user account:
  - a. On the **Maintenance** menu, click **System Management** > **Change Password**.
  - b. Enter a password.
  - c. Click Finish.
- **7.** Set the user IP address.
  - a. On the Maintenance Utility menu, click Network Settings.

Chapter 12: Changing the storage IP address

- b. In the Network Settings window, click Set Up Network Settings.
- c. Set the IP address for controller 1 and controller 2.
- d. Click **Apply**.
- 8. Click Log Out to close the maintenance utility.
- 9. Change the storage system IP address in the **Storage Device List** window.
- **10.** Set the SVP IP address.
- **11.** Change the SVP IP address in the **Storage Device List**.
- **12.** If you assigned a temporary IP address to the client PC, change it to meet the subnet of your network environment.

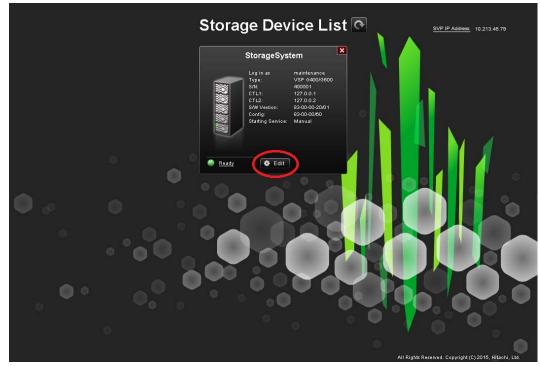

**Note:** If you encounter a problem, troubleshoot the spanning tree protocol.

## Changing storage system information in the Storage Device List

#### Procedure

1. In the **Storage Device List** window, click the **Edit** button for the storage system you want to edit.

The **Edit System** window opens.

Edit System				
Set values for the new System and click Apply to confirm.				
Software: Software Selection:		Browse		
System Selection:	Auto Discovery     Manual			
Connect Information:				
IP Address (CTL1):	IPv4     IPv8     I0.213.75.134			
IP Address (CTL2):	IPv4 IPv6 10.213.75.136			
System Information:				
System Name:	unit0 ( Max, 180 characters )			
Description:				
	(Max, 180 characters, or blank)			
User Information:				
User Name:	maintenance ( Max, 256 characters )			
Password:	(Max, 256 characters )			
Start service automatically, when the SVP is rebooted.				
	Apply	Cancel		

2. Enter the items to be changed, and then click **Apply**.

Note: To change Software, do not select Manual of System Selection to set it. Clear Start service automatically, when the SVP is rebooted check box when:

- Storage systems running **S/W Version** 83-01-xx or later are registered.
- Multiple storage systems are registered.

Chapter 12: Changing the storage IP address

## **Chapter 13: Changing the SVP IP address**

You can change the IP address for the SVP using the Windows 7 or 10 operating system on the SVP or the Storage Device List.

## **Changing the SVP IP address in Windows 7**

Use this procedure if a storage system is not registered on the SVP or the storage system service has not started.

#### Procedure

- 1. On the SVP, click Start > Control Panel > Network and Sharing Center.
- 2. Click Change adapter settings.
- 3. Click a network for which you want to set an IP address, and then set the IP address.

## Changing the SVP IP address using Storage Device List

To change the SVP IP address in Storage Device List, change the IP address registered using the SVP's Windows operating system, and then perform the following procedure.

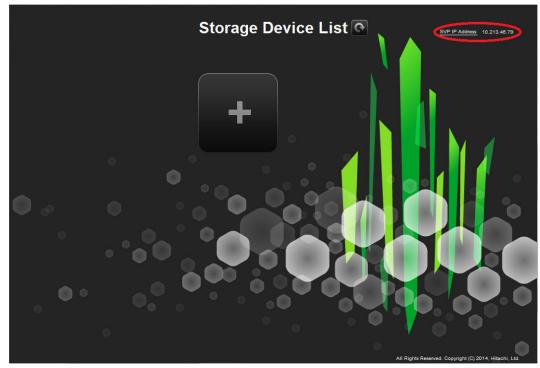

#### Before you begin

- Do not register the storage system on the SVP.
- Do not start the start the storage system service.

#### Procedure

- On the SVP, click Start > All Programs > Device Manager Storage Navigator > StorageDeviceList. The Storage Device List window opens.
- 2. In the top-right side of the window, click SVP IP Address.

Chapter 13: Changing the SVP IP address

The Change SVP IP Address window opens.

Change SVP IP Address				
Set IP address for the SVP and click Apply to confirm.				
and ener Apply to commit.				
	3			
10.231.98.137				
	Apply	Cancel		

- 3. Click IPv4 or IPv6.
- 4. Enter the new IP address of the SVP.
- 5. Click Apply.

Chapter 13: Changing the SVP IP address

# Chapter 14: Changing and initializing SVP port numbers

If other applications are using the port numbers used by the SVP, change the SVP port numbers. You can also revert the SVP port numbers to their original settings if necessary.

## **Changing SVP port numbers**

You can change the SVP port numbers in supported applications. If you use a firewall, change and apply your firewall settings before you change the SVP port numbers. Unused port numbers are automatically allocated for some port numbers of the SVP software with SVP software version later than 83-03-01-xx/00.

#### Before you begin

Verify the client PC is already connected to the SVP through Remote Desktop Connection.

#### Procedure

- 1. Request all users to log out of Device Manager Storage Navigator.
- 2. On the SVP, exit to a Windows command prompt as Administrator.
- 3. Change to the directory to the location of the tool MappSetPortEdit.bat.
- 4. Enter the following command: C:\Mapp\wk\Supervisor\MappIniSet
  \MappSetPortEdit.bat \_ [port number key name] \_ [port number]
  where \_ indicates a space and the values [] indicate a parameter. For example:
  >cd C:\Mapp\wk\Supervisor\MappIniset\mappsetportedit.bat
  MAPPWebServer 10001
  - **Note:** In this command, C:\MAPP indicates the installation directory of the storage management software and SVP software. If the installation directory is not C:\Mapp, replace C:\Mapp with the appropriate installation directory.

Chapter 14: Changing and initializing SVP port numbers

The following table shows the port numbers you can use. The communication direction is outbound between the client PC to the SVP.

**Note:** Refer to the following table for port number assignments if the storage system is using a physical service processor.

Port number key name (Windows Firewall				
Inbound name)	Protocol	Initial value of port number	Can the port be closed?	SVP software version
MAPPWebServ er	HTTP	80	Yes	83-01-20- xx/00 or later
MAPPWebServ erHttps	HTTPS	443	No	
RMIClassLoad er	RMI	51099	No	
RMIClassLoad erHttps	RMI (SSL)	5443	No	
RMIIFRegist	RMI	1099	No	
PreRMIServer	RMI	51100-51355 <sup>1</sup>	No	
		Automatic allocation		83-03-01- xx/00 or later
DKCManPrivat e	RMI	11099	N/A	83-01-24- xx/00 or later
SMI-S (SLP)	SLP	427	Yes, only if SMI-S is not used.	
SMIS_CIMOM	SMI-S	5989-6244 <sup>1</sup>	Yes, only if SMI-S is not	83-01-20- xx/00 or later
		Automatic allocation	used.	83-03-01- xx/00 or later
CommonJettyS tart	НТТР	8080	N/A	83-01-24- xx/00 or later
CommonJettyS top	HTTP	8210	N/A	
RestAPIServer Stop	HTTP	9210	N/A	

Chapter 14: Changing and initializing SVP port numbers

Port number key name (Windows Firewall Inbound name)	Protocol	Initial value of port number	Can the port be closed?	SVP software version
DeviceJettySta	HTTP	8081	N/A	
rt		Automatic allocation		83-03-01- xx/00 or later
DeviceJettySto p	HTTP	8211	N/A	83-01-24- xx/00 or later
		Automatic allocation		83-03-01- xx/00 or later
Hi-Track	HTTPS, FTP (SSL)	4431	Yes, only if Hi- Track is not used.	83-04-00- xx/00 or later

#### Note:

1. When the SVP software version is 83-03-01-xx/00 or later, unused port numbers are allocated automatically from the described range during storage system registration and a firewall is also set. The allocated ports numbers are used when starting the storage system. When the SVP software version is earlier than 83-03-01-xx/00, ports 51100 and 5989 are used respectively.

Chapter 14: Changing and initializing SVP port numbers

The following TCP/IP port assignments are used by the storage system, other devices, and applications.

Port number	Usage description
80	Used by the SVP, Hitachi Storage Advisor, and Device Manager - Storage Navigatorto communicate through the HTTP protocol.
161	UDP (SNMP uses this port to send traps from the storage system) .
427	Used by SMI-S.
1099	Used by Hitachi Command Suite products JAVA RMI Registry server.
2000	TCP (Device Manager - Storage Navigator: Nonsecure)
	Cisco Skinny Client Control Protocol (SCCP) uses port 2000 for TCP. If you use Device Manager - Storage Navigator in a network with SCCP, change the TCP port that Device Manager - Storage Navigator uses (refer to the Device Manager - Storage Navigator online help).
5989	Used by SMI-S.
10995	TCP Device Manager - Storage Navigator and Hitachi suite components)
23015	Used for Web browser communications.
23016	Used for Web browser communications via SSL.
28355	TCP (Device Manager - Storage Navigator: Secure)
31001	Used for communication by Hitachi Command Control Interface (CCI) data collection procedures.
34001	Used by RAID Manager.
51099	Used by Device Manager - Storage Navigator for communication.
51100	Used by Device Manager - Storage Navigator for communication.

- The effective range of the port number is 0 to 65535. Select a number that is not already in use by another service.
- Do not use port numbers from 1 to 1023 because they are reserved in other applications. Instead, change the port numbers to 1024 or higher. However, the port numbers of 2049, 4045, and 6000 cannot be used for MAPPWebServer and MAPPWebServerHttps.

Multiple command input parameters "[Port Number Key] \_ [Port Number]" can be specified. The \_ character indicates a space. For example:

```
MappSetPortEdit.bat MAPPWebServer 81 MAPPWebServerHttps 444
```

• A management file of the port numbers used in the SVP follows. For example: The management file of the port numbers is for reference only and should not be changed. Close the management file of the port numbers when issuing the change (initialization) command.

```
<The directory where the tool exists>\mpprt\cn \mappsetportset.properties
```

```
C:\Mapp\wk\Supervisor\mappiniset\mpprt\cnf
\mappsetportset.properties
```

- Verify the port numbers to be used in the SVP. See <u>Viewing the port number to</u> be used in the SVP (on page 225).
- The completion message is displayed following the service restart message.
- The port number key name is case sensitive.
- 5. A service restart message appears followed by a completion message.
- 6. At the message Press any key to continue, press any key to continue.
- **7.** Exit from the command prompt.

## **Initializing SVP port numbers**

You can reset SVP port numbers to their initial setting. Resetting the port numbers restarts the SVP. To initialize the automatically allocated port numbers, see <u>Initializing</u> <u>automatically allocated port numbers (on page 222)</u>.

#### **Before you begin**

- Connect the management console PC to the SVP.
- Verify the client PC is already connected to the SVP using Remote Desktop Connection.
- Verify that you are logged out of HDvM SN.

#### Procedure

1. On the SVP, exit to a Windows command prompt as Administrator.

2. Change to the directory where the tool MappSetPortEdit.bat is located, and then issue the following command: C:\Mapp\wk\Supervisor\MappIniSet \MappSetPortEdit.bat

**Tip:** In this command, C:\MAPP indicates the installation directory of the storage management software and SVP software. If the installation directory is not C:\Mapp, replace C:\Mapp with the appropriate installation directory.

A confirmation message appears.

- **3.** Enter y and press **Enter**. A service restart message appears followed by a completion message.
- 4. At the message Press any key to continue, press any key to continue.
- **5.** Exit from the command prompt.

## Behavior when changing SVP port numbers

If you change an SVP port number, observe the following considerations.

Port number key name	Effect
MAPPWebServer	Using Hitachi Device Manager - Storage Navigator
	The URL specification method to log on to Storage Navigator changes.
	Using Hitachi Command Suite
	Match the port number used in Hitachi Command Suite to <svp change="" port="">.</svp>
MAPPWebServerHttps	<b>Using Hitachi Device Manager - Storage</b> <b>Navigator</b> : None
	Using Hitachi Command Suite
	Match the port number used in Hitachi Command Suite to <svp change="" port="">.</svp>
RMIClassLoader	None
RMIClassLoader	Using Hitachi Command Suite
	Match the port number used in Hitachi Command Suite to <svp change="" port="">.</svp>

RMIClassLoaderHttps	Using <b>Hitachi Device Manager - Storage</b> Navigator
	When using the raidinf command (a program for obtaining configuration reports and obtaining tier relocation logs) to log on to Device Manager - Storage Navigator, specify <svp change="" port=""> in addition to the SVP IP address or host name.</svp>
RMIIFRegist	When issuing the remote power ON/OFF tool (RmtPsTool) command, specify <svp Change Port&gt; for the Management Server Port Number parameter.</svp 
	When issuing the export tool command, specify <svp change="" port=""> in addition to the SVP IP address using ip Subcommand to the SVP IP address.</svp>
	Using Hitachi Command Suite
	Match the port number used in Hitachi Command Suite to the new SVP port.
PreRMIServer	None
DKCManPrivate	None
SMI-S (SLP)	Using SMI-S:
	Match the port number used in the SMI-S communication to <svp change="" port="">.</svp>
SMIS_CIMOM	Match the port number used in the SMI-S communication to <svp change="" port="">.</svp>
	For a storage system running firmware version 83-03-01-xx/00 or later, register the storage system, and then set it after verifying the port numbers to be used (see <u>Viewing the port number to be used in the SVP (on page 225)</u> )
CommonJettyStart	None
CommonJettyStop	None
RestAPIServerStop	None
DeviceJettyStart	None
DeviceJettyStop	None

## Reallocating automatically allocated port numbers

You can reassign the port numbers automatically allocated to the storage system. When the port numbers assigned to the storage system are used in other applications, the port numbers are reallocated to the ports.

## Note:

- Stop the service of the storage system to be reallocated, and then perform reallocation. If the service is performed without stopping it, stop the service of the target storage system in the **Storage Device List** window, and then start the service.
- The DeviceJettyStart and DeviceJettyStop ports that are allocated when the storage system service is started are not reallocated.
- When the function using the ports is disabled, delete the allocated port numbers.

#### Procedure

- **1.** Log out of Hitachi Device Manager Storage Navigator from the storage system to be reallocated.
- **2.** Stop the service of the storage system.
- **3.** On the SVP, start a Windows command prompt as an Administrator.
- 4. Change the current directory to the directory where the tool exists. Run the following command: C:\Mapp\wk\Supervisor\MappIniSet \MappPortManageRenum.bat [Serial number] (arbitrary)

The character indicates a space. The values in [] indicates a parameter.

When the [Serial number] is omitted, the command is performed for storage systems running firmware version 83-03-01-xx/00 or later.

**Tip:** In this command, C: \MAPP indicates the installation directory of the storage management software and SVP software. If the installation directory is not C: \MAPP, replace C: \MAPP with the appropriate installation directory.

- **5.** The confirmation message for reallocation is displayed. To continue the processing, enter y, and then press **Enter**. To cancel the processing, enter n, and then press **Enter**.
- **6.** Close the command prompt.
- 7. Start the services of the reallocated storage system.

## Initializing automatically allocated port numbers

#### Before you begin

- Verify the client PC is already connected to the SVP through the Remote Desktop Connection.
- Stop the services of all the storage systems that have a Ready status in the **Storage Device List** window, and then initialize them.
- If storage systems are initialized without stopping the services, the storage system port numbers get reallocated automatically. For more information, see <u>Reallocating</u> <u>automatically allocated port numbers (on page 221)</u>.

#### Procedure

- 1. Log out of Device Manager Storage Navigator.
- 2. In the **Storage Device List** window, stop the services of all the storage systems that have a **Ready** status.
- **3.** On the SVP, start a Windows command prompt as an Administrator.
- 4. Change the current directory to the directory where the tool exists and run the following command: C:\Mapp\wk\Supervisor\MappIniSet \MappPortManageInit.bat

**Tip:** C: \MAPP indicates the installation directory of the storage management software and SVP software. If the installation directory is not C: \Mapp, replace C: \Mapp with the appropriate installation directory.

- **5.** At the confirmation message for reallocation, enter *y* and press **Enter** to continue or enter *n* and press **Enter** to cancel the processing.
- 6. At the completion message, press any key to continue.
- 7. Perform the reallocation by running the following command: C:\Mapp\wk \Supervisor\MappIniSet\MappPortManageRenum.bat\_[Serial number] (arbitrary)

If the [Serial number] is omitted, the command is performed for storage systems running firmware version 83-03-01-xx/00 or later.

**Tip:** C:\MAPP indicates the installation directory of the storage management software and SVP software. When the installation directory, other than C:\Mapp is specified, replace C:\MAPP with the specified installation directory.

- **8.** At the confirmation message for reallocation, type <sub>Y</sub> and press **Enter** to continue or type n and press **Enter** to cancel the processing.
- **9.** At the completion message, press any key to continue.
- **10.** Repeat steps 6 through 9 to reallocate the port numbers for all the registered storage systems.
- **11.** Close the command prompt.

**12.** Start the service of the storage system.

# Changing range of port numbers to be allocated automatically

## Before you begin

Verify that the client PC is already connected to the SVP through the Remote Desktop Connection.

#### Procedure

- 1. On the SVP, start a Windows command prompt as an Administrator.
- 2. Change the current directory to the directory where the tool exists and run the following command: C:\Mapp\wk\Supervisor \MappIniSet>MappPortRangeSet.batr[Service port number]\_[Range of port numbers]
  - **Tip:** C:\MAPP indicates the installation directory of the storage management software and SVP software. If the installation directory is not C:\Mapp, replace C:\Mapp with the appropriate installation directory.

## Note:

**Port number key name** and **Default value of port number range** can be changed as shown in the following table. Zero number port is not allocated regardless of this command setting.

Port Number Key Name	Default value of port number range	Comments
PreRMIServer	51100 to 51355	-
SMIS_CIMOM	5989 to 6244	-
DeviceJettyStart	48081 to 48336	-
DeviceJettyStop	48411 to 48666	-
N/A	1 to 1023	Port numbers that are not used by automatic allocation

- The effective range of the port number range is 1 to 65535. Set the port numbers so as to avoid conflict with those used in other services.
- Port numbers 1 to 1023 are reserved in other applications. If 1 to 1023 are excluded from the unavailable setting value, the applications might not operate normally.
- The available character strings in the effective range are as follows:

"Number" "," "-" "rm"

If "rm" is specified, delete the setting of the specified port number key.

 You can specify more than one command input parameter "[Service port number key name] \* [Port number range] where \* is a one-byte space.

For example, MappPortRangeSet.bat PreRMIServer 51200-55000 SMIS\_CIMOM 5989-6244,8000

• The port number range set for unavailable cannot be used, even if it is an effective range for other keys.

For example, when PreRMIServer 51100-51355 unavailable 51100-51200 is set, the port number range allocated by PreRMIServer is 51201 to 51355.

- **3.** A completion message appears. Press any key to continue.
- **4.** Close the command prompt.

# Initializing range of port numbers to be allocated automatically

You can initialize the range of the port numbers automatically allocated to the storage system.

## Before you begin

Verify the client PC is already connected to the SVP through a Remote Desktop connection.

## Procedure

- 1. On the SVP, start a Windows command prompt as an Administrator.
- 2. Change the current directory to the directory where the tool exists and run the following command: C:\Mapp\wk\Supervisor\MappIniSet \MappPortRangeInit.bat

**Tip:** C: \MAPP indicates the installation directory of the storage management software and SVP software. If the installation directory is not C: \Mapp, replace C: \Mapp with the appropriate installation directory.

**3.** The confirmation message for reallocation is displayed. To continue the processing, enter y, and then press **Enter**. To cancel the processing, enter n, and then press **Enter**.

A completion message appears. Press any key to continue.

**4.** Close the command prompt.

## Viewing the port number to be used in the SVP

You can view the port numbers to be used in the SVP.

## Before you begin

Verify the client PC is already connected to the SVP through the Remote Desktop connection.

## Procedure

- 1. On the SVP, start a Windows command prompt as an Administrator.
- 2. Change the current directory to the directory where the tool exists and run the following command: C:\Mapp\wk\Supervisor\MappIniSet \MappPortRefer.bat [Serial number] (arbitrary)

The character indicates a space. The values in [] indicates a parameter.

When the serial numbers are omitted, the information of all the storage systems registered in Storage Device List is displayed.

- **Tip:** C: \MAPP indicates the installation directory of the storage management software and SVP software. If the installation directory is not C: \Mapp, replace C: \Mapp with the appropriate installation directory.
- **3.** The information of the port numbers to be used in the SVP is displayed. For the ports whose numbers are not allocated, **Not Defined** is displayed.
- **4.** A completion message appears. Press any key to continue.
- **5.** Close the command prompt.

## **Chapter 15: Editing the Storage Device List**

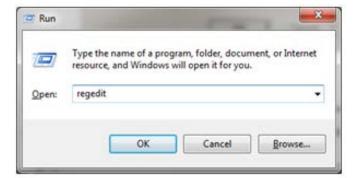

If you change the storage system IP address or the maintenance password, edit the Storage Device List to reflect the change.

#### Procedure

- 1. If your network uses the spanning tree protocol (STP) Bridge Protocol Data Unit (BPDU) guard on your network, perform the following Registry changes. Otherwise, skip to step 2:
  - a. If you use the physical SVP supplied by Hitachi Vantara, verify the following connections.

- b. If you use the physical SVP supplied by Hitachi Vantara, remove the cable from the **LAN1** port on the SVP.
- c. Click Start > Run.
- d. In the Run dialog box, type regedit, and then click OK.

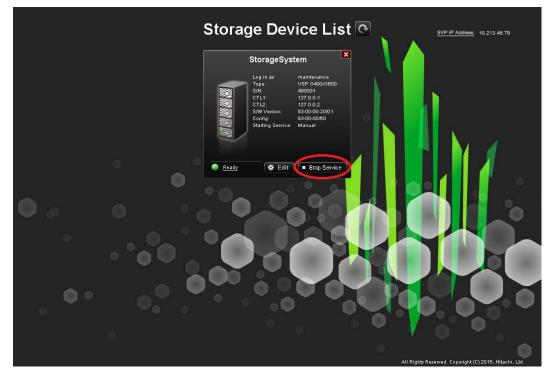

- e. Go to the following key: HKEY\_LOCAL\_MACHINE\SYSTEM \CurrentControlSet\Services\BridgeMP
- f. Right-click New > DWORD (32-bit Value), and then type DisableSTA.

Ele Edit View Favorites BridgeMP		Name		Data
	-		Туре	1
Browser	-131	(Default)	REG_SZ	(value not set)
Brserid		ab Device	REG_SZ	¥Device¥{D940C8D7-84CD-42A8-9580-4F16B92C5302
BrSerWdm		118 DisableSTA	REG_DWORD	0x00000001(1)
BrUsbMdm		ab DisplayName	REG_SZ	@%SystemRoot%¥system32¥bridgeres.dl,-1

		ab ImagePath	REG EXPAND SZ	system32#DRIVERS#bridge.sys
bthserv		116 Start	REG_DWORD	0x00000003 (3)
cdfs cdrom		11 Tag	REG_DWORD	0x0000000a (10)
CertPropSvc		118 Type	REG_DWORD	0x00000001(1)

g. For the DisableSTA DWORD, change the hexadecimal Value data value to 1, and then click **OK**.

Edit DWORD (32-bit)	Value X
Value <u>n</u> ame:	
DisableSTA	
⊻alue data: ∎	Base <u>H</u> exadecimal <u>D</u> ecimal
	OK Cancel

- h. Restart the SVP, reconnect the cable to the **LAN1** port on the SVP, and verify connectivity through the network to the SVP.
- 2. Using Remote Desktop Connection, access the SVP using the storage system's maintenance LAN port of 10.0.0.100.
- **3.** In the **Storage Device List** window, click **Stop Service**. Wait up to five minutes for the service to stop.

**4.** Log on to the maintenance utility.

**13.** In the **Storage Device List** window, click **Start Service**. At the confirmation message, click **Confirm**.

- **14.** Using Remote Desktop Connection, access the SVP using the new user LAN IP address.
- **15.** Open the **Storage Device List** window and verify that services are ready.

Chapter 15: Editing the Storage Device List

- **16.** Verify information internet service (IIS) FTP settings.
  - a. Using a maintenance PC, from the Control Panel, open **Administrative Tools** and start **Internet Information Services (IIS) Manager**.
  - b. If the default website and the existing FTP server (including H8SRV) are registered, right-click the FTP server under **Sites**, and then click **Delete**.

At the **Confirm Remove** message, click **Yes**. Repeat this step for the default website and other FTP servers.

c. Right-click **Sites**, and then click **Add FTP Site**.

Chapter 15: Editing the Storage Device List

i. If you use FTP (IIS), disable the security software. For Symantec Endpoint Protection, for example, right-click the **Symantec Endpoint Protection** icon on the desktop, and then click **Disable Symantec Endpoint Protection**.

Chapter 15: Editing the Storage Device List

# Chapter 16: Deleting and registering the storage system

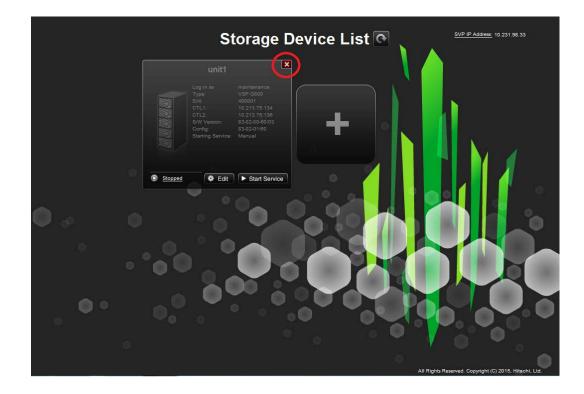

In the unlikely event you need to delete the storage system from the Storage Device List, use the following instructions to delete the storage system, and then register it on the SVP.

# Deleting the registered storage system from the Storage Device List

Use the following procedure if you must delete the registered storage system from the **Storage Device List** window.

#### Procedure

- 1. Stop the SVP service (see <u>Stopping and restarting the service in each storage system</u> (on page 176)).
- 2. On the SVP desktop, double-click the **Open StorageDeviceList** icon. The **Storage Device List** window opens.
- **3.** In the **Storage Device List** window, click **x** for the storage system that you want to delete.

## Registering the storage system on the SVP

If you delete the registered storage system from the SVP, you can register the storage system.

## Before you begin

- Verify the to-be-registered storage system is operating, and the IP addresses of the SVP and the storage system are using the same subnet.
- Upgrade the firmware for the storage system being registered.

This procedure takes approximately 10 minutes for each storage system to be registered and approximately 200 minutes for each storage system that needs a firmware upgrade.

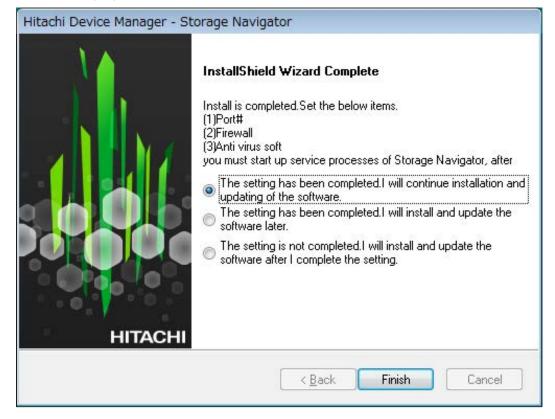

•
-

**Note:** The upgrade time can take up to 9 hours to complete when NAS modules are installed.

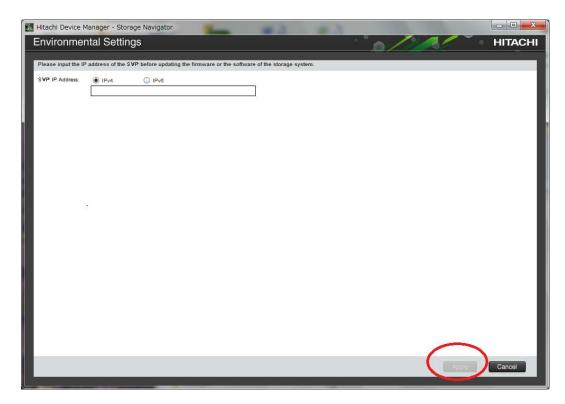

## Procedure

- **1.** At the console PC connected to the physical SVP or running the SVP software, insert the media containing the SVP firmware media.
- **2.** On the SVP, create a new folder, and then copy all of the files from the SVP firmware media into the new folder.
- 3. In the new folder, right-click the Setup.exe file and click Execute as Administrator.

- In the following screens, click Next, accept the license agreement and click Next, and then click Yes. If the Windows Security Alert window opens, click Allow access.
- **5.** Select the top option and then click **Finish**.

**6.** When prompted, select the IP addressing method (**IPv4** or **IPv6**), enter the IP address of the port connecting the SVP and the storage system, and then click **Apply**.

7. When the target storage systems list window opens, click Add.

🛃 Hitachi Device Manager - Storage Navigator

	Apply Cancel

8. In the Add System window, complete the fields.

Field	Description
System Selection <sup>1</sup>	Select one of the following methods to discover the storage system.
	<ul> <li>Auto Discovery: Acquire the storage system information automatically. (default)</li> </ul>
	<ul> <li>Manual: Specify the storage system manually.</li> </ul>

Field	Description
IP Address (CTL 1)	Enter the IP address for controller 1. Accept the default <b>IPv4</b> setting or click <b>IPv6</b> , and then enter the IP address in the appropriate format for the addressing method selected.
IP Address (CTL 2)	Enter the IP address for controller 2. Accept the default <b>IPv4</b> setting or select <b>IPv6</b> , and then click the IP address in the appropriate format for the addressing method selected.
System Name	Enter the display name of the storage system, up to 180 characters. Permitted characters are one-byte alphanumeric characters and symbols (# \$ % & ' * + / = ? @ ^ _ ` {   } ~). You cannot use one-byte spaces.
Description	Enter the description of the storage system, up to 180 characters.
User Name	Enter a user name. Permitted characters are one-byte alphanumeric characters and symbols (# \$ % & ' * + / = ? @ ^ _ ` {   } ~). The GUI includes a 256-character limit.
Password	Enter a password. The GUI includes a 256-character limit.
Do not start service after addition immediately <sup>2</sup>	Select if you do not want to start service after adding the storage system. (Default is unchecked.)

## Notes:

1. Service personnel set the storage system information manually. User should not select **Manual** to set it.

2. To register multiple storage systems, best practice is to check this check box for the settings so that they do not start services while they are added.

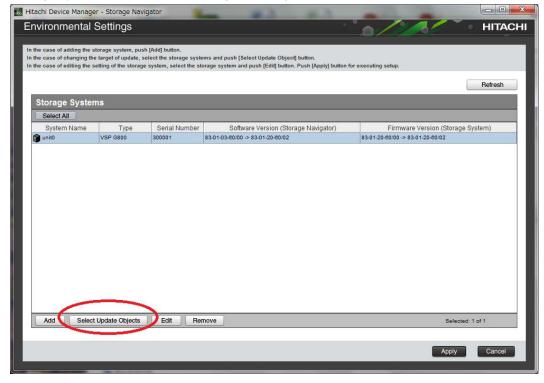

## 9. Click Apply.

The storage system is added to the target storage systems list window.

The **Update Firmware[Online]** window shows the status of the firmware upgrade. When the upgrade completes, the following window opens.

- 18. Click OK.
- **19.** Wait for the firmware upgrade to complete, and then verify the firmware update status in the **Firmware (Storage System)** column of the **Environmental Settings** window. Wait for the firmware update to complete. The following table lists the status conditions.

Description
Click <b>Update</b> to display the <b>Update</b> <b>Firmware</b> window.
The <b>Update Firmware</b> window started and the firmware upgrade is not complete. This status appears even if the firmware upgrade is canceled.
Firmware upgrade is complete.
Firmware upgrade failed. Click <b>Update</b> to display the <b>Update Firmware</b> window, and review the error details.
The time <sup>1</sup> required to complete the firmware upgrade cannot be confirmed. Verify the state in the <b>Update</b> <b>Firmware</b> window.
Not selected as a firmware upgrade target.

#### Note:

1. When NAS Modules are not installed, the installation time is approximately 3.5 hours. When NAS modules are installed, the installation time is approximately 9 hours.

**20.** When the firmware upgrade completes, click **Close**.

## Chapter 17: Back up and restore the SVP

Best practices dictate that you back up the SVP configuration to a USB flash drive. That way, if the SVP fails, you can use the backup to restore the configuration.

## Backing up the SVP configuration

Back up the SVP configuration to a USB flash drive using a Remote Desktop connection. After the configuration is backed up, you can use the back up to restore the configuration if necessary.

When you back up the SVP configuration, the following items are also backed up:

- Parameters set in the Device Manager Storage Navigator Environment window
- Connection setting to the authentication server
- Connection setting to the key management server
- Password policy for backing up the encryption key on the client PC
- Window view setting (table width)
- Warning message in the logon window
- Task information
- SMI-S application settings
- HTTPS and SMI-S SSL certificates, and RMI

#### Procedure

- **1.** From a management console PC, connect to the SVP using Windows Remote Desktop Connection.
- 2. Close all Device Manager Storage Navigator sessions on the SVP.
- 3. On the SVP, exit to a Windows command prompt as Administrator.
- 4. Move to the directory where the tool exists, and then issue the following command:

```
C:\MAPP\wk\Supervisor\MappIniSet\MappBackup.bat [absolute path of the backup (tgz zip) file]
```

**Note:** In this command, C:\MAPP indicates the installation directory of the SVP. If the installation directory is different, replace C:\MAPP with the specified installation directory.

5. At the completion message, press any key to continue.

Chapter 17: Back up and restore the SVP

- 6. Exit the command prompt.
- 7. Move the configuration file from the SVP to a USB flash drive.

**Note:** Do not edit the contents of the backup file.

## **Restoring the SVP configuration**

If you backed up the SVP configuration, you can use the following procedure to restore the configuration. This procedure is particularly useful when you receive a replacement SVP and want to install a configuration that was used on your previous SVP.

#### Before you begin

- Verify the client PC is connected to the SVP through a Remote Desktop Connection.
- Check the storage system you want to restore is registered on the SVP.
- Configure the service setting to not start automatically when the SVP restarts.

#### Procedure

- 1. Copy the backup file to a folder on the SVP.
- 2. On the SVP, exit to a Windows command prompt as Administrator.
- **3.** Move to the directory where the backup file exists, and then issue the following command:

```
C:\MAPP\wk\Supervisor\MappIniSet\MappRestore.bat[absolute path of the backup (tgz zip) file]
```

- **Note:** In this command, C:\MAPP indicates the installation directory of the SVP. If the installation directory is different, replace C:\MAPP with the specified installation directory.
- **4.** At the restoration message, press any key to continue.
- **5.** Configure the service setting that you want to start automatically the next time the SVP restarts (see Changing storage system information in the Storage Device List).
- 6. Restart the SVP. Wait approximately 10 minutes for the restart to complete.

## **Chapter 18: Rebooting the SVP**

There might be times when you need to shut down and restart the SVP.

## Shutting down the SVP

## Procedure

- 1. On the SVP, click **Start** in the Windows desktop.
- 2. From the displayed menu, click Windows Security.
- 3. In the **Windows Security** window, click the up arrow option in the power menu.
- **4.** From the displayed menu, click **Shut down**. If you have the physical SVP supplied by Hitachi Vantara, the POWER LED goes off.

## **Restarting the SVP**

#### Procedure

- 1. On the SVP, click **Start** in Windows desktop.
- 2. From the displayed menu, click **Windows Security**.
- 3. In the Windows Security window, click the up arrow option in the power menu:

4. From the displayed menu, click **Reboot**.

## Chapter 19: Replacing the Hitachi Vantarasupplied SVP

Use the following information to detect SVP failures and replace the physical SVP if necessary.

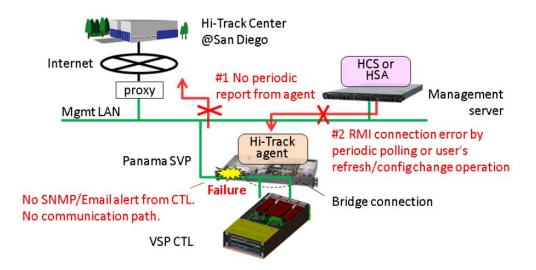

**Important:** The Hitachi Vantara-supplied SVP can only be installed, upgraded, or replaced by a Hitachi Vantara representative or an authorized service provider. Contact a Hitachi Vantara representative for more information about installing, upgrading, or replacing a Hitachi Vantara-supplied SVP.

## **Detecting SVP failures**

SVP failures are detected and resolved using the following methods.

Failure detection method	How a failure is detected	Action to be taken
Hi-Track Remote Monitoring System	No report from the agent during a 24-hour health check	Hi-Track detects SVP failure -> SVP replacement. For information about Hi-Track, go to the Hi-Track website: <u>http://hitrack.hds.com/</u> .
Hitachi Command Suite (HCS)	RMI connection error (not alert)	See the <i>Hitachi Command</i> <i>Suite Administrator Guide</i> (MK-90HC175).
Hitachi Storage Advisor (HSA)	Hardware alerts appear in Alert tiles, along with drill- down views for detailed information.	See Hitachi Storage Advisor User Guide (MK-94HSA004).

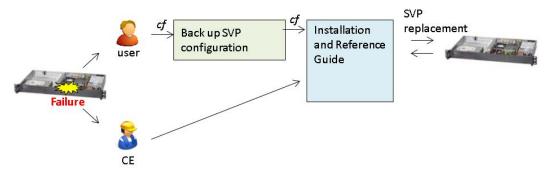

Chapter 19: Replacing the Hitachi Vantara-supplied SVP

## **Replacing the physical SVP**

If the physical SVP supplied by Hitachi Vantara must be replaced, users back up the configuration and then return the failed SVP to Hitachi Vantara. When users receive the new SVP, they restore the configuration using the backup from the failed SVP.

The procedures for backing up and restoring the SVP configuration are in the Hardware Guide for your system.

## Recovering the operating system

Recovery of the SVP operating system is achieved using Operating System Recovery Tool (OSRT).

The SVP supports OSRT as a backup solution for the C: partition. With this tool, users or CEs can back up the C: partition and restore it at any time, without requiring a USB. This tool can recover the SVP from OS or data corruption on the C:\ partition.

Chapter 19: Replacing the Hitachi Vantara-supplied SVP

## Backing up the OS

#### Procedure

- 1. Start the SVP.
- 2. At the Basic Input/Output System (BIOS) screen, press F8.
- **3.** Select a partition for the backup.
- 4. Exit the BIOS and restart the SVP.

## **Restoring the OS**

#### **Procedure**

- **1.** Start the SVP.
- **2.** At the BIOS screen, press F8.
- **3.** Select an image to restore.
- 4. Exit the BIOS and restart the SVP.

## Configuring the replacement physical SVP

If you receive a replacement physical SVP, prepare the SVP for use.

#### Procedure

- **1.** Identify the local-area connection assignments for the SVP ports.
- 2. Rename the four internal SVP network adapters.
- **3.** Configure the SVP for bridge mode or change the default TCP/IP settings of the SVP network ports for your subnet.
- 4. Install the Hitachi Device Manager Storage Navigator software.
- 5. Install the Hi-Track Remote Monitoring system.

Steps 1 through 4 are described in the procedures that follow. For information about installing Hi-Track, go to <u>http://hitrack.hds.com/</u>.

## Mapping the internal SVP network adapters

The SVP has four internal network adapters that correspond to four external RJ-45 jacks. When you receive a new SVP, use the following procedure to assigning the adapters to Local Area Connection numbers.

#### Procedure

- **1.** If any LAN cables are connected to the SVP ports, disconnect them.
- 2. Click Control Panel > Network and Sharing Center.
- 3. Click Change adapter settings.

**4.** Verify that all four SVP LAN adapters are recognized, but disconnected, and that the local-area connection numbers are assigned as 5, 6, 7, and 8.

**5.** Connect an Ethernet cable to the LAN1 port on the SVP. Local Area Connection 7 is assigned to the LAN1 port.

**6.** Remove the Ethernet cable from the LAN1 port and connect it to the LAN2 port on the SVP.

Local Area Connection 6 is assigned to the LAN2 port.

 Repeat step 6 with the LAN3 and LAN4 ports on the SVP. When you connect the Ethernet cable to these ports, Local Area Connection 8 will be assigned to the LAN3 port and Local Area Connection 5 will be assigned to the LAN4 port.

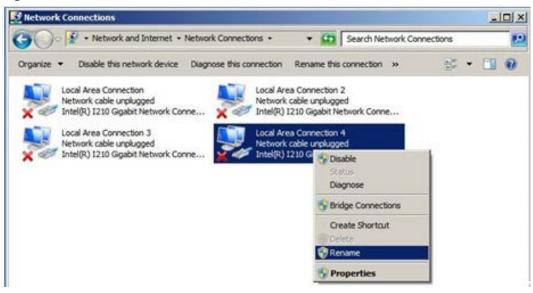

**Note:** Verify that no IP address is configured for the SVP LAN ports. Otherwise, the storage system could become blocked.

Renaming the internal SVP network adapters

#### Procedure

1. Right-click LAN1 (Local Area Connection 4), and then click Rename.

- 2. Change the name to Management (User).
- **3.** Repeat step 1 and step 2 to rename the other three SVP network adapters as follows.

Change the name of this SVP adapter	to this name	Adapter configuration
LAN1	Management(User)	Bridge for the management LAN
LAN2	Maintenance	Maintenance LAN
LAN3	Management(CTL1)	Management LAN
LAN4	Management(CTL2)	Bridge for the management LAN

 Leave the Network Connections window open. Then either configure the SVP for bridge mode or configure the IP addresses for the SVP LAN ports to match the IP addressing scheme of your subnet.

## **Setting the IP address**

After renaming the internal SVP network adapters, perform the initial startup procedures to specify the IP addresses for the SVP and storage system.

#### Procedure

- **1.** Connect a PC to the LAN2 port on the SVP.
- 2. Log on to the SVP using the Remote Desktop Connection:

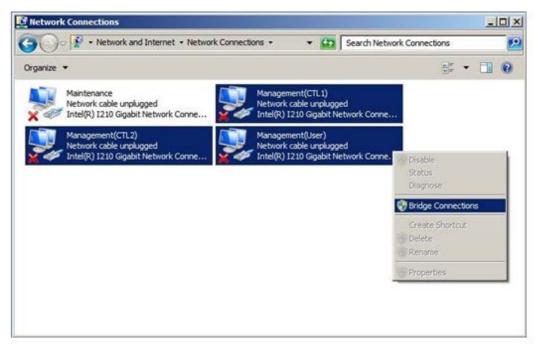

- a. Configure the PC to use an IP address of 10.0.0.xxx, where xxx = 1-99 or 101-254, and a subnet mask of 255.255.255.0.
- b. Click **Start > All Programs**, and then click **Accessories > Remote Desktop Connection**.
- c. In the **Computer** field, type 10.0.100 and click **Connect**.
- d. In the **Windows Security** screen, type SVP-PC\SVP in the top field and raid-login in the bottom field.
- e. Click **OK**.
- f. If prompted that the identity of the remote computer cannot be verified, click **Yes** to continue.
- **3.** In the Remote Desktop Connection window, click **Control Panel** > **Network and Sharing Center**.
- 4. Click Change adapter settings.
- 5. In the **Network Connections** window, right-click the **Management(CTL1)** network adapter, which corresponds to SVP physical port LAN3, and click **Properties**.
- 6. In the Local Area Connection Properties window, double-click Internet Protocol version 4 (TCP/IPv4) or Internet Protocol version 6 (TCP/IPv6), depending on the IP addressing schemes used on your subnet.
- 7. In the dialog box, click **Use the following IP address**.
- **8.** Enter the IP address, subnet mask, and gateway settings in the appropriate fields, and then click **OK**.
- 9. Click OK to close the Local Area Connection Properties window.
- In the Network Connections window, right-click the Management(CTL2) network adapter, which corresponds to the LAN4 port on the physical SVP, and click Properties. Then repeat steps 3 through 7 to assign the TCP/IP settings for this network adapter.
- **11.** Close the **Network connections** window.

## **Configuring bridge settings**

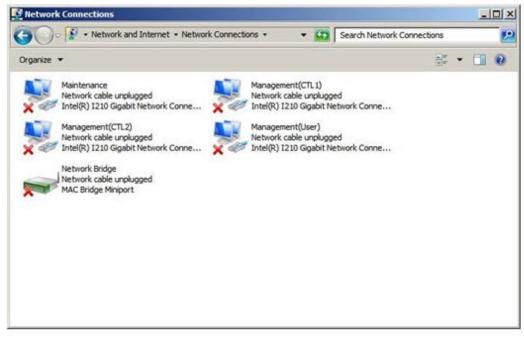

If your environment requires the SVP to operate in bridge mode, you can configure the SVP to operate in bridge mode after you rename the four internal SVP network adapters. In this mode, SVP ports LAN3 and LAN4 connect to the LAN management port on each controller.

#### Procedure

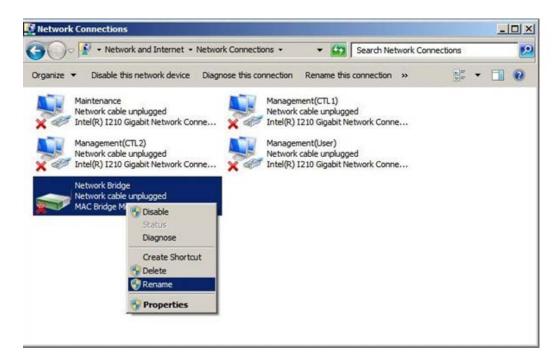

- 1. In the **Network Connections** window, click the LAN1 adapter, and then hold down the Ctrl key and click the LAN3 and LAN4 network adapters.
- 2. Right-click the mouse and click **Bridge Connections**.

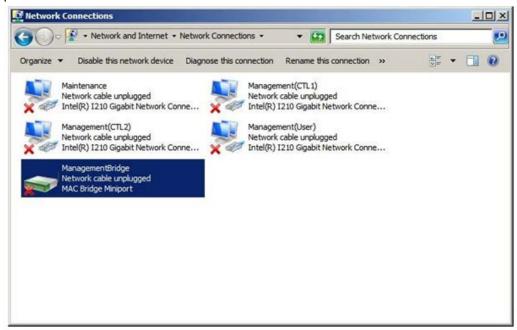

A new instance of Network Bridge appears.

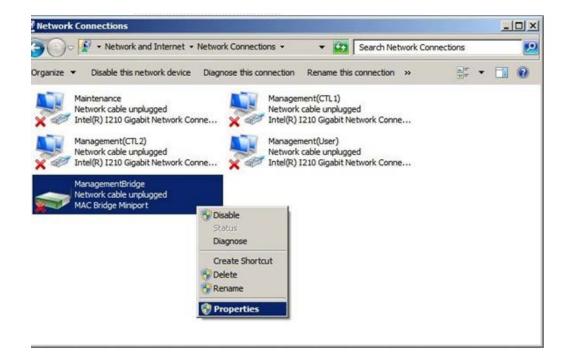

3. Right-click the Network Bridge icon, and then click Rename.

4. Change the name to ManagementBridge. Type this name as one word, with no spaces.

5. Right-click the ManagementBridge icon, and then click Properties.

6. Click Internet ProtocolVersion 4 (TCP/IPv4).

## Installing Hitachi Device Manager - Storage Navigator

The procedure for installing the Device Manager - Storage Navigator software takes approximately 10 minutes.

#### Procedure

- 1. Connect a PC to the LAN2 port on the SVP.
- 2. Insert the attached SVP firmware media into the PC's CD drive or DVD drive.
- **3.** On the root folder of the SVP firmware media, right-click **Setup.exe**, and then click **Execute as Administrator**.
- 4. In the Choose Setup Language window, click a language, and then click Next.

Hitachi Device Manager - St	torage Navigator - InstallShield Wi	zard 🕞 🖻 🔜
Choose Setup Language Select the language for the in	nstallation from the choices below.	24
(English (United States) Japanese		
InstallShield	< gack Next	> Cancel

The **Preparing Setup** window appears while the software is prepared for installation.

5. At the Install Shield window, click Next.

6. At the License Agreement window, accept the terms of the license agreement, and then click Next.

	OK Cancel

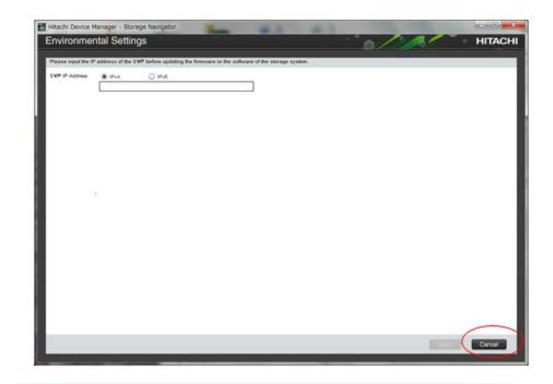

**8.** If a confirmation window appears, click **Yes**. If the Windows Security Alert window appears, click **Allow access**.

A status bar shows the progress of the installation.

- **9.** When the following completion message appears, perform one of the following steps:
  - To continue, click **The setting has been completed**. I will continue installation and updating of the software.
  - To set port numbers, firewall settings, and anti-virus software, click The setting is not completed. I will install and update the software after I complete the setting.

	InstallShield Wizard Complete Install is completed.Set the below items. [1]Port# [2]Firewall
HITAC	<ul> <li>(3)Anti virus soft you must start up service processes of Storage Navigator, after you must start up service processes of Storage Navigator, after updating of the software.</li> <li>The setting has been completed.1 will install and update the software later.</li> <li>The setting is not completed.1 will install and update the software after 1 complete the setting.</li> </ul>

- 10. Click Finish.
- **11.** At the **Environmental Settings** window, click **IPv4** or **IPv6**, and then enter the IP address of the SVP and click **Apply**.

**Note:** If you do not want to configure the SVP IP address at this time, click **Cancel**. When you are ready to specify the IP address, restart the SVP, and then set the SVP IP address using the procedure under <u>Setting</u> the IP address (on page 255).

Ē

## **Chapter 20: Troubleshooting**

In the unlikely event you encounter a problem with the SVP, use this information to identify and resolve the issue.

## Troubleshooting the spanning tree protocol

To identify redundant paths, the SVP generates and processes Bridge Protocol Data Units (BPDUs) on ports 1, 3, and 4. If the SVP connects to a network switch that has its spanning tree feature enabled, the network switch can block communications between the SVP and the network. An example of a configuration is Cisco switches equipped with the PortFast BPDU guard feature is enabled.

If you connect the SVP to the port of a network switch that has BPDU guard enabled, connect the SVP to a different port on the switch that does not have the BPDU guard feature enabled. If this does not resolve the problem, perform the following procedure to stop the SVP port from issuing BPDU frames.

**Note:** If you perform this procedure while the cable connection between the SVP and network switch is looped, it creates a logical loop of the network connection and the entire network becomes inoperable. Verify the network connection is not looped before performing this procedure.

#### Procedure

- From the PC connected to the SVP, click Start > All Programs > Accessories > Remote Desktop Connection.
- 2. Right-click the command prompt and click **Run as Administrator**.
- 3. At the command prompt, type regedit.
- 4. Edit the following registry settings:

HKEY\_LOCAL\_MACHINE\SYSTEM\CurrentControlSet\Services\BridgeMP

Name: DisableSTA

Value: DWORD (0x1)

5. Restart the SVP operating system. The SVP port no longer transmits BPDU frames.

## SVP emergency logon procedure

The SVP can be connected using the default IP address 192.168.0.15.

Chapter 20: Troubleshooting

If you cannot connect to the SVP by using the default IP address, use the following
emergency log on address: http://<default SVP IP address>/dev/storage/
<model number><system serial number>/emergency.do. The following table lists
the variables in the URL.

If your storage system model number is	and the storage system serial number is	type the following URL
8320004	456789	http://192.168.0.15/dev/ storage/8320004456789/ emergency.do
8340004	456789	http://192.168.0.15/dev/ storage/8340004456789/ emergency.do
8360004	456789	http://192.168.0.15/dev/ storage/8360004456789/ emergency.do

Chapter 20: Troubleshooting

# Appendix A: SVP replacement list

The following table lists the product codes for replacement SVPs.

Component	Available for VSP model	Product code
Service processor (Windows 10 Enterprise)	VSP G350 and VSP G370	HDW2-F850-SVP.P
	VSP F350 and VSP F370	
	VSP G700	
	VSP F700	
	VSP G900	HDW-F850-SVP.P
	VSP F900	
	VSP G200	HDW2-SVP2OS10.P
	VSP G400, G600, G800	HDW-SVP2OS10.P
	VSP F400, F600, F800	FHW-SVP2OS10.P
Service processor (Windows 7)	VSP G200	3919435-HDW2.P
	VSP G400, G600, G800	3919435.P
	VSP F400, F600, F800	H3919435.P
