## Conventions for storage capacity values

Physical storage capacity values (for example, disk drive capacity) are calculated based on the following values:

Physical capacity unit	Value

Logical capacity values (for example, logical device capacity, cache memory capacity) are calculated based on the following values:

Logical capacity unit	Value
1 block	512 bytes
1 cylinder	Mainframe: 870 KB Open-systems: <ul style="list-style-type: none"> <li>▪ OPEN-V: 960 KB</li> <li>▪ Others: 720 KB</li> </ul>
1 KB	1,024 (2 <sup>10</sup> ) bytes
1 MB	1,024 KB or 1,024 <sup>2</sup> bytes
1 GB	1,024 MB or 1,024 <sup>3</sup> bytes
1 TB	1,024 GB or 1,024 <sup>4</sup> bytes

# Chapter 1: Introduction

Audit logs are created on the Service Processor (SVP) computer in the storage system. You can access the audit logs that are output by the SVP, but the SVP is accessible only by support personnel.

## Overview

The audit log is an important tool that you can use to keep track of operations, to monitor security, to investigate the cause of errors, and to avoid potential errors.

Audit logs are created on the SVP computer in the storage system. You can access the audit logs that are output by the SVP, but the SVP is accessible only by support personnel.

Audit logs store the following histories:

- Operations performed from a Device Manager - Storage Navigator computer or an SVP.
- Commands that the storage system received from a host, a computer using CCI, or a host using Business Continuity Manager.
- Operations and events about encryption keys for data encryption.

The history may not be output in chronological order. This history includes the user, the time of the operation, the name of the operation, any parameters set, and the end result (normal completion or error message). Each audit log file ends with a serial number, from 0,000,000,000 to 4,294,967,295. When the number reaches 4,294,967,295, it resets and starts over at 0,000,000,000.

There are two types of audit log files:

- Audit log file, which consists of two files:
  - Auditlog information file 1 contains operations performed from the Device Manager - Storage Navigator computer or SVP, and operations about encryption keys.
  - Auditlog information file 2 contains commands sent from a host, a computer using CCI, or a host using Business Continuity Manager, and events about encryption keys.

You can download them to your Device Manager - Storage Navigator computer or transfer to a primary or secondary FTP server.

- Syslog file. This file contains the audit log. You can download it to your Device Manager - Storage Navigator computer or transfer it to a primary or secondary syslog server.

The syslog file has two types of formats: RFC3164-compliant and RFC5424-compliant. You can select either of the formats when downloading syslog files and transferring syslog files to syslog servers.

## Features

The audit log feature stores a history of all operations performed on a computer using the Device Manager - Storage Navigator feature. This history includes the user, the time of the operation, the name of the operation, any parameter set, and the end result (normal completion or error message). The audit log file records until full and then starts over, rerecording from the beginning of the file.

## Audit Log file description

### Detailed Information

The indexes and setting values that indicates the set items are output to the detailed information. There are two types of the detailed information format.

#### Detailed information format 1

Example:

```
+Copy Type=TI
++{P-VOL(LDKC:CU:LDEV),S-VOL(LDKC:CU:LDEV),PoolID,MU,
Snapshot Group,Result}
=[{0xXX:0xAA:0xBB,0xYY:0xCC:0xDD,0,1,SnapshotSet1,Normal end},
{0xXX:0xAA:0xBB,0xYY:0xCC:0xDD,0,,SnapshotSet2,Error(xxxx-yyyy)}],
Num. of Pairs=2
```

Symbol	Definition
+ and -	'+' or '-' displays at the beginning of a line.  '+' means the beginning of the index. The number of occurrences of '+' represents the number of indents.  '-' means that the line continues from the previous line.
=	Connects an index and a setting value.
[ ]	When there is more than one setting value for an index, the setting values are enclosed by [ ], and separated by a comma (,).  Example: CU:LDEV=[0x00:0x00,0x00:0x01,0x00:0x02]
{ }	Details are enclosed by {}.  Example: {Port,Fabric,Connection}=[{1E,ON,FC-AL},{3E,OFF,P-to-P}]
( )	Supplementary and additional information for setting values are enclosed by ().  Example: {VOL(CU:LDEV),Result}={0x00:0x01,Error(xxxx-yyyy)}

**Note:**

- If there is an item that is not specified when entering commands or performing operations, a hyphen (-) is output for its setting value, no setting value is output, or the index itself is not output.
- For audit logs generated by commands sent from hosts, computers using CCI, or hosts using Business Continuity Manager, if an invalid value is specified when entering commands, numerical characters might be output in the index for character strings and vice versa.
- For audit logs generated by events related to encryption keys, if an audit log to be output contains invalid values, numerical characters might be output in the index for character strings or nothing is output for detailed information.
- For audit logs output in Audit log information file 2 (DKC), values different from the specified ones might be output because optimal values might be automatically assigned in DKC.

**Detailed information format 2**

Example:

```
+{Alus[0] {
  Id="60-06-0E-81-30-76-D9-30-76-D9-00-00-00-00-49",
  Result=Normal end,LdevId=0x00:0x00:0x49}}
```

**Note:** Line feeds are added to make the example easy to see, while no line feed is added to the actual logs.

Symbol	Definition
+ and -	'+' or '-' displays at the beginning of a line. <ul style="list-style-type: none"> <li>▪ '+' means the beginning of the index. The number of occurrences of '+' represents the number of indents.</li> <li>▪ '-' means that the line continues from the previous one.</li> </ul>
{ }	The tiering relation is indicated by the following format. <i>Parent setting item{Child setting item 1, Child setting item 2{Grandchild setting item 2-1, Grand child setting item 2-2,...},...}</i>
=	Connects an index and a setting value.
[x]	For the log output by the command or operation in which multiple resources or items of the same type can be set at one time, the resource or item of the same type is indicated as follows. <i>Setting item[x]</i> (where x is a number: 0, 1, 2,...)

**Note:** If there is an item that is not specified when entering commands or performing operations, "null" is output for its setting value, or the index itself is not output.

## Chapter 2: Using audit logs

You can download audit log files and syslog files to Device Manager - Storage Navigator computer or transfer audit log files to FTP servers or syslog servers.

### Downloading audit log files

Download the audit log files to Device Manager - Storage Navigator computer to prevent the old data from being overwritten. It takes from one to five minutes to download the audit log file.

**Warning:** Do not download the audit log file to the Device Manager - Storage Navigator computer if the audit log is set to be transferred to an FTP server. Some information may not be transferred to the FTP server because the line counter resets when the audit log file is manually downloaded. Download the file only when the FTP server has failed and cannot receive the audit log file. If you want to transfer the audit log to the FTP server after downloading the log, transfer it manually. See [Manually transferring audit log files to FTP servers \(on page 51\)](#) for more information.

#### Before you begin

- You must have Audit Log Administrator (View Only) or Audit Log Administrator (View & Modify) role to download audit log files.

#### Procedure

1. Click **Audit Log** on the menu bar of the Device Manager - Storage Navigator main window. The **Audit Log Properties** window opens. Each icon displayed on the menu bar indicates the accumulated status of the audit log information.
  -  indicates the number of saved lines is below the threshold.
  -  indicates the number of saved lines is above the threshold, but the data is still being saved.
  -  indicates the number of saved lines has exceeded the maximum, and data is partly lost because the newest lines were overwritten the oldest lines.
2. Click **Download (SVP)** or **Download (DKC)** to open the Save As dialog box. **Download (SVP)** downloads the auditlog information file 1 and **Download (DKC)** downloads the auditlog information file 2.
3. Select a destination for the file and click **Save**.
4. Click **Close** to close the Audit Log Properties window.

## Downloading syslog files

Syslog files stored in the storage system can be downloaded to the Device Manager - Storage Navigator computer as necessary. It takes from one to five minutes to download the syslog file.

### Before you begin

- You must have Audit Log Administrator (View Only) or Audit Log Administrator (View & Modify) role to download syslog files.

### Procedure

1. Click **Settings > Security > Edit Audit Log Settings**. Select **Syslog** tab on the **Edit Audit Log Settings** window.
2. Select **Transfer Protocol**. The output file format is different by the selected protocol.
3. Click **Download Syslog**. The Specify the Destination dialog box appears.
4. Enter the destination and the file name and click **Save**.

## Automatically transferring audit log files to FTP servers

If you configure FTP server settings, the audit log will be automatically transferred to the FTP server when the number of lines in the file reaches the threshold.

**Note:** Keep a list of the items such as the IP address you entered in the FTP tab on Edit Audit Log Settings window. You may need to enter them again when an SVP is replaced.

### Before you begin

- You must have Audit Log Administrator (View & Modify) role to configure FTP server settings.
- Ensure that SVP is connected to the FTP server on a LAN.

### Procedure

1. Click **Settings > Security > Edit Audit log Settings**. Select **FTP** tab on the **Edit Audit Log Settings** window.
2. Perform the following if using a primary FTP server.
  - a. Click **Enable** the Primary Server.
  - b. Select **IPv4** or **IPv6** on **IP Address** setting and enter the IP address.
  - c. Enter the user name and the password you use to log in to the primary FTP server.
  - d. Enter the output folder to which the audit log file is sent with the relative path from the home directory.
3. Perform the following if using a secondary FTP server.

- a. Click **Enable** the Secondary Server.
  - b. Select **IPv4** or **IPv6** on **IP Address** setting and enter the IP address.
  - c. Enter the user name and the password you use to log in to the secondary FTP server.
  - d. Enter the output folder to which the audit log file is sent with the relative path from the home directory.
4. Click **Finish**.
  5. Confirm the settings from the setting confirmation window, and then enter the task name on **Task Name**.
  6. Click **Apply**. The task is registered. If you check the **Go to tasks window for status** check box, the **Task** window is displayed.
  7. Manually transfer the audit log file to confirm that the FTP server setting is correct.
    - a. Check that the transfer setting task to the FTP server is complete on the **Task** window. If the task has not completed, wait until it is complete.
    - b. Transfer the audit log file to the FTP server manually to confirm that the FTP server setting is correct. For details of manual transfer, see [Manually transferring audit log files to FTP servers \(on page 51\)](#).

### Troubleshooting

A SIM notifies a storage administrator that an FTP transfer has failed. This can occur when the audit log file is not transferred to an FTP server because either the FTP server or LAN has failed. You can view the SIM in the Alerts window. The reference code for a failed FTP transfer is 7C0300. If a SIM is reported, do the following:

- Resolve the error on the FTP server or LAN, and then manually transfer the audit log file. And then complete the SIM referring to [Completing SIM generated when FTP transfer of audit log files failed \(on page 50\)](#).

If the instructions in SIM is not complete, SIM will not be generated on next transfer failure.

- If the error condition cannot be resolved, download the audit log file to the Device Manager - Storage Navigator computer by clicking Audit Log on the upper right of the Device Manager - Storage Navigator main window.

## Completing SIM generated when FTP transfer of audit log files failed

### Before you begin

- You must have Audit Log Administrator (View & Modify) and Storage Administrator (System Resource Management) role to complete SIM.

### Procedure

1. Click **Settings > Security > Edit Audit log Settings**. Select **FTP** tab on the **Edit Audit Log Settings** window.

2. Select **Complete SIMs** check box.
3. Click **Finish**.
4. Confirm the settings from the setting confirmation window, and then enter the task name on **Task Name**.
5. Click **Apply**. The task is registered. If you check the **Go to tasks window for status** check box, the **Task** window is displayed.

## Manually transferring audit log files to FTP servers

You can transfer the audit log file manually from the SVP to the FTP server.

### Before you begin

- You must have Audit Log Administrator (View Only) or Audit Log Administrator (View & Modify) role.
- Ensure that SVP is connected to the FTP server on a LAN.
- Transfer setting to the FTP server must be finished. For how to set, refer to [Automatically transferring audit log files to FTP servers \(on page 49\)](#).

### Procedure

1. Click **Settings > Security > Edit Audit log Settings**. Select **FTP** tab on the **Edit Audit Log Settings** window.
2. Click **Transfer to Primary Server** or **Transfer to Secondary Server**. A message appears indicating that the transfer has completed.

## Transferring audit log to syslog servers

If you configure syslog server settings, the audit log will always be transferred to the syslog server and stored as the syslog files.

You can select either of the following protocols to transfer the audit log to the syslog server. The output file format is different by the selected protocol.

- TLS1.2/RFC5424
- UDP/RFC3164

**Note:** When you use UDP/RFC3164, consider the characteristics of UDP (User Datagram Protocol) when designing a network. See <http://www.ietf.org/rfc/rfc3164.txt> (Request for Comments) issued by IETF (Internet Engineering Task Force) for more details.

**Note:** Keep a list of the items such as the IP address you entered in the Syslog tab on Edit Audit Log Settings window. You may need to enter them again when an SVP is replaced.

### Before you begin

- You must have Audit Log Administrator (View & Modify) role to configure syslog server settings.
- Make sure the storage system is connected to syslog servers on a LAN.
- Make sure the syslog servers are configured so as to transfer audit logs to the syslog servers.
- The syslog server certificate and the client certificate is required to use TLS1.2/RFC5424.

**Caution:** If audit logs are transferred before configuring the setting of a syslog server to which the audit logs are transferred, the logs are not saved on the syslog server and lost. See the user manual of the syslog server for the details of the syslog server setting.

### Procedure

1. Click **Settings > Security > Edit Audit Log Settings**. Select **Syslog** tab on the **Edit Audit Log Settings** window.
2. Select **New Syslog Protocol (TLS1.2/RFC5424)** or **Old Syslog Protocol (UDP/RFC3164)**.
3. Click **Enable** the Primary Server.
  - a. Select **IPv4** or **IPv6** on **Server setting** and enter the IP address.
  - b. Enter the Port Number in the primary server setting.
  - c. Enter client certificate file name, password, and root certificate file name (only when you choose **New Syslog Protocol (TLS1.2/RFC5424)** at **Transfer Protocol**).
4. Perform the following if using a secondary syslog server.
  - a. Click **Enable** the Secondary Server.
  - b. Select **IPv4** or **IPv6** on **Server setting** and enter the IP address.
  - c. Enter the Port Number in the secondary server setting.

## Chapter 7: Audit log examples of PIN Deletion Tool operation

This topic provides examples and descriptions of the audit logs produced by the PIN Deletion Tool.

For detailed information on the version numbers in log output examples, see the table for format changes for each version number in [Log output formats for different versions \(on page 36\)](#).

### [PINDeletion] Delete

This log information indicates the completion of the PIN deletion operation, and does not indicate the completion of the PIN deletion processing.

#### Example

```
08xx,YYYY/MM/DD,HH:MM:SS.xxx, 00:00,SVP,uid=user-name,1,,
[PINDeletion],Delete,,Normal end,

```

#### Detailed Information

Item	Description
LDKC:CU:LDEV	The LDKC, CU, and LDEV numbers
Num. of LDEVs	The number of set LDEVs

## Appendix A: Audit log user operations

This topic describes the Device Manager - Storage Navigator operation and the corresponding operation name output to audit logs. A user can perform an operation either using a Device Manager - Storage Navigator menu, or clicking a button or using General Tasks in the main window, and the same log is output for the operation selected in different ways.
